# AERONAUTICAL ENGINEERING

**A SPECIAL BIBLIOGRAPHY  
WITH INDEXES  
Supplement 39**

**JANUARY 1974**

---

**NATIONAL AERONAUTICS AND SPACE ADMINISTRATION**

## ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges:

IAA (A-10000 Series)	A73-43191—A73-45560
----------------------	---------------------

STAR (N-10000 Series)	N73-31925—N73-33931
-----------------------	---------------------

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Tisco, Inc.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 1, 1974.

# AERONAUTICAL ENGINEERING

## A Special Bibliography

### Supplement 39

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in December 1973 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

Scientific and Technical Information Office  
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION  
JANUARY 1974  
Washington, D.C.

**This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22151, for \$3.00. For copies mailed to addresses outside the United States, add \$2.50 per copy for handling and postage.**

# INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering—A Special Bibliography* (NASA SP-7037) lists 417 reports, journal articles, and other documents originally announced in December 1973 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries* in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes—subject, personal author, and contract number—are included.

An annual cumulative index will be published.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A73-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc., (AIAA), as follows: Paper copies are available at \$5.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche<sup>(1)</sup> are available at the rate of \$1.00 per microfiche for documents identified by the # symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g., A73-10468, when requesting publications.

## STAR ENTRIES (N73-10000 Series)

A source from which a publication abstracted in this Section is available to the public is ordinarily given on the last line of the citation, e.g., Avail: NTIS. The following are the most commonly indicated sources (full addresses of these organizations are listed at the end of this introduction):

Avail: NTIS. Sold by the National Technical Information Service at the price shown in the citation. If no price is shown in a current *STAR* citation, it may be ascertained by referring to *Government Reports Announcements* or to NTIS. Beginning with documents announced in Issue 21, 1973, "stocked" reports, such as printed NASA reports are priced on a step schedule ranging irregularly from \$2.75 for a 1-to-25 page report to \$10.75 for 576 to 600 pages, plus \$2.00 for each additional 100-page increment. Demand print reports (those for which a facsimile reproduction will be made to fill orders) are priced at \$3.00 for the first 20 pages plus 25 cents for each five pages or portions thereof. These prices are not applied retroactively; i.e., reports previously announced at a certain price continue to be sold at that price. If "Avail: NTIS" without a price appeared in the citation of a NASA report (asterisked) it is sold at \$3.00 whether printed copy or facsimile is supplied. Because of price changes and possible surcharges, it is recommended that for any document announced in *STAR* before July 1970, NTIS be queried as to the price. Document prices are subject to change without notice. See "Avail: SOD" below for documents available from both the Superintendent of Documents and NTIS.

**Microfiche.** Microfiche is available from NTIS at a standard price of \$1.45 (regardless of age) for those documents identified by the # sign following the accession number (e.g., N73-10281#) and having an NTIS availability shown in the citation. Standing orders for microfiche of (1) the full collection of NTIS-available documents announced in *STAR* with the # symbol, (2) NASA reports only (identified by an asterisk (\*)), (3) NASA-accessioned non-NASA reports only (for those who wish to maintain an integrated microfiche file of aerospace documents by the "N" accession number), or (4) any of these classes within one or more *STAR* categories, also may be placed with NTIS at greatly reduced prices per title (e.g., 45 cents) over individual requests. Inquiries concerning NTIS Selective Categories

(1) A microfiche is a transparent sheet of film, 105 x 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 24:1 reduction).

in Microfiche should be addressed to the Subscription Unit, National Technical Information Service.

*Deposit Accounts and Customers Outside U.S.* NTIS encourages its customers to open deposit accounts to facilitate the purchase of its documents now that prices vary so greatly.

NTIS customers outside the United States are reminded that they should add the following handling and postage charges to the standard or announced prices: *hard (paper) copy*, \$2.50 each document; *microfiche*, \$1.50 each document. For subscribers outside the United States who receive microfiche through the Selective Categories in Microfiche program, NTIS will add 15 cents for each title shipped.

**Avail:** SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The price is given following the availability line. (An order received by NTIS for one of these documents will be filled at the SOD price if hard copy is requested. NTIS will also fill microfiche requests, at the standard \$1.45 price, for those documents identified by a # symbol.)

**Avail:** NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the Mississippi Test Facility, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

**Avail:** NASA Scientific and Technical Information Office. Documents with this availability are usually news releases or informational brochures available without charge in paper copy.

**Avail:** AEC Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of U.S. Atomic Energy Commission reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the USAEC and its depositories are described in a booklet, *Science Information Available from the Atomic Energy Commission* (TID-4550), which may be obtained without charge from the USAEC Technical Information Center.

**Avail:** Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts*, and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each, regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.

**Avail:** HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc., (PHI), Redwood City, California. The U.S. price (including a service charge) is given, or a conversion table may be obtained from PHI.

**Avail:** BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown (If none is given, inquiry should be addressed to BLL).

**Avail:** ZLDI. Sold by the Zentralstelle für Luftfahrtokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).

**Avail:** Issuing Activity, or Corporate Author, or no indication of availability: Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

**Avail:** U.S. Patent Office. Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of \$.50 each, postage free.

**Other availabilities:** If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## **GENERAL AVAILABILITY**

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

## **SUBSCRIPTION AVAILABILITY**

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements, excluding the annual cumulative index, is \$18.00. All questions relating to subscriptions should be referred to the NTIS.

## TYPICAL CITATION AND ABSTRACT FROM STAR

## TYPICAL CITATION AND ABSTRACT FROM IAA

# AERONAUTICAL ENGINEERING

A Special Bibliography (Suppl. 39)

JANUARY 1974

## IAA ENTRIES

**A73-43205 #** A note on the flow in a trailing vortex. K. K. Tam. *Journal of Engineering Mathematics*, vol. 7, Jan. 1973, p. 1-6. 7 refs. National Research Council of Canada Grant No. A-5228.

It is shown that if the equations governing the fluid motion in a trailing vortex are linearized, as was done by Batchelor, more than one solution can be constructed. Within the framework of the linear theory, there is no criterion to determine which solution is to be used. To clarify the situation, the Navier-Stokes equations are formulated in parabolic coordinates, and asymptotic solutions are sought which are valid far downstream. By insisting that the interaction of the swirl with the uniform stream be a first-order effect, the first two terms in the asymptotic expansions for the Stokes stream function and the angular momentum are obtained. The result thus obtained differs from that given by Batchelor in that the axial velocity defect decays algebraically. (Author)

**A73-43210 #** On the application of a new version of lifting surface theory to nonslender and kinked wings. T. E. Labrujere (Nationaal Luchtvaartlaboratorium, Amsterdam, Netherlands) and P. J. Zandbergen (Technische Hogeschool Twente, Enschede, Netherlands). *Journal of Engineering Mathematics*, vol. 7, Jan. 1973, p. 85-96.

Results of a determination of the characteristics of thin wings in subsonic flow by a new elaborate method. Attention is paid to the rate of convergence of the numerical solutions, especially with respect to the number of collocation points. Two rectangular wings have been treated in order to examine the influence of the aspect ratio. The influence of the rounding of a kink is demonstrated by means of a series of constant-chord wings with hyperbolic edges. (Author)

**A73-43263 #** Glide modes in problems with a conflict situation (Skol'ziashchie rezhimy v zadachakh s konfliktnoi situatsiei). E. V. Kuzin. In: *Studies of spacecraft flight dynamics*. Moscow, Izdatel'stvo Nauka, 1973, p. 33-43. 5 refs. In Russian.

The necessary conditions for the existence of an optimal control on a set of glide modes are formulated. The optimality conditions obtained are extended to cover problems with a conflict situation. V.P.

**A73-43277** Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973. Sponsored by the International Federation of Automatic Control, Consiglio Nazionale delle Ricerche, and Associazione Nazionale Italiana per l'Automazione. Edited by G. Guardabassi, A. Locatelli, and S. Rinaldi (Milano, Politecnico, Milan, Italy). Dusseldorf,

International Federation of Automatic Control; Pittsburgh, Instrument Society of America, 1973. 462 p. \$25.

Topics discussed include model reference adaptive techniques, sensitivity and covariance matrices for performance estimation, the effect of feedback control on trajectory sensitivity, the use of the state-space and transfer-function concepts in the design of linear multivariable systems, the synthesis of feedback systems which minimize the effect of sensor white noise at the plant input, the synthesis of parameter- and state-insensitive feedback systems, automatic aircraft landing control, the sensitivity of optimal control systems, the design of adaptive models for real-time identification, the design of discrete model reference adaptive systems, the design of multivariable adaptive models, the synthesis of a two-level controller for linear plants, and the effect of structural perturbations on large-scale dynamic systems.

A.B.K.

**A73-43284** Optimal landing flare control of aircrafts with sensitivity consideration. H. Ohta and I. Sugiura (Nagoya University, Nagoya, Japan). In: *Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973*. Dusseldorf, International Federation of Automatic Control; Pittsburgh, Instrument Society of America, 1973, p. 251-259. 8 refs.

Theoretical synthesis of an automatic closed-loop optimal landing flare control system characterized by reduced sensitivity. The reduced sensitivity system shows excellent responsiveness to flight velocity and mass parameter variations. Further theoretical and experimental studies are necessary for putting the obtained results into practice. M.V.E.

**A73-43288** Design of multivariable adaptive model following control systems. I. D. Landau and B. Courtiol (Société Générale de Constructions Electriques et Mécaniques Alsthom, Grenoble, France). In: *Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973*.

Dusseldorf, International Federation of Automatic Control; Pittsburgh, Instrument Society of America, 1973, p. 315-322. 5 refs. Research supported by the Délégation Générale à la Recherche Scientifique et Technique.

The results for the problems of perfect model following and hyperstability of model reference adaptive systems are integrated in order to develop a general design method for multivariable adaptive model following control systems. Two types of adaptation are involved: adaptation of the parameters of the control loop and signal synthesis adaptation for model following control systems with a fixed structure. The design and the implementation of the adaptation mechanism based on the use of a hyperstable adaptation algorithm are discussed. The feasibility and the advantages of the procedure are illustrated by applying it to a nontrivial aircraft control problem. (Author)

**A73-43296** The effect of variable environment temperature on heat transfer in extended surfaces. D. Pnueli (Technion - Israel Institute of Technology, Haifa, Israel). (Israel Conference on

*Mechanical Engineering, 7th, Haifa, Israel, June 27, 28, 1973.* Israel Journal of Technology, vol. 11, no. 4, 1973, p. 233-235.

Extended surfaces appear as structural members in aircraft. These fin-like parts are subjected to temperatures which can be well above those considered safe. Heat transfer analysis must yield the temperatures which are actually reached by these members. Because modern aircraft design cannot allow for large safety factors, the thermal analysis must be rather accurate. Therefore, a general solution for heat transfer in fins with variable environment temperatures is presented. It is generalized to include variable convection coefficients. Two examples are also presented. (Author)

**A73-43327** Emissions from and within an Allison J-33 combustor. II - The effect of inlet air temperature. J. H. Tuttle, R. A. Altenkirch, and A. M. Mellor (Purdue University, West Lafayette, Ind.). *Combustion Science and Technology*, vol. 7, no. 3, 1973, p. 125-134. 10 refs. Environmental Protection Agency Grant No. R-801284.

A model of the flow pattern within an Allison J-33 combustor using unheated inlet air was previously postulated (Mellor et al., 1972), based on internal measurements. Additional data consistent with the postulated flow model were obtained from the same combustor using heated inlet air at near design conditions. Profiles of gas temperature, carbon monoxide, unburned hydrocarbons, and nitric oxide concentrations are reported as a function of axial and radial position inside the combustor. Combustor exit-plane pollutant concentrations are also reported; specifically, the effects of combustor pressure, overall equivalence ratio, air flow rate, and inlet air temperature were investigated. (Author)

**A73-43385** Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading. A. E. Armenakas (Brooklyn, Polytechnic Institute, Brooklyn, N.Y.) and C. A. Sciammarella (Illinois Institute of Technology, Chicago, Ill.). *Experimental Mechanics*, vol. 13, Oct. 1973, p. 433-440. 11 refs. Contract No. F33615-71-C-1533.

**A73-43396** A study of a fluidic open loop damping flight stability augmentation system. F. Holoubek (Royal Aircraft Establishment, Farnborough, Hants., England). In: Cranfield Fluidics Conference, 5th, Uppsala, Sweden, June 13-16, 1972, Proceedings. Volume 1. Cranfield, Beds., England, British Hydromechanics Research Association, 1973, p. C3-49 to C3-68. 7 refs.

The ideas underlying the open loop damping method of stability augmentation for flight attitude control systems, its parametric design, and laboratory performance testing are described. The use of conventional response rate feedback, requiring some form of a rate gyroscope, is obviated, in a feed-forward manner, by operating on the demand signal by means of shaping network in such a way as to achieve a system response identical or similar to that realized by the application of rate feedback. The obvious advantage of such an arrangement is the absence of the need of any differentiation, which is here replaced by relatively easier time integration (lead-lag RC networks). The paper outlines the derivation of a suitable shaping function and the calculation of the necessary gains and time constants. (Author)

**A73-43466** # Improvement of the corrosion-fatigue strength of aluminum alloys by exposure of the medium to a magnetic field (Povyshenie korrozionno-ustalostnoi prochnosti aluminievogo splava pri obrabotke sredi magnitnym polem). A. V. Karlashov and I. I. Priakhin (Kievskii Institut Inzhenerov Grazhdanskoi Aviatsii, Kiev, Ukrainian SSR). *Fiziko-Khimicheskaja Mekhanika Materialov*, vol. 9, no. 4, 1973, p. 23-26. 7 refs. In Russian.

A 7000-Oe unipolar constant magnetic field was applied to corrosive media (3% aqueous solution of NaCl, fresh water, and a

petroleum fuel) flowing at 0.5 m/sec. The test temperature was 20 C and the usable length 100 mm. It is shown that the fatigue strength in pure bending of aircraft aluminum 2-mm sheet samples exposed to the magnetized medium was greater than in the absence of a magnetic field. V.P.

**A73-43493** # Closing the air transport gap on intermodal containers. J. L. Weingarten (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-30*. 8 p. 7 refs. Members, \$1.00; nonmembers, \$3.00.

The intermodal container today is still limited to movement by land and sea. The United States Air Force is currently working to close this gap and provide true intermodality. A three-prong approach is underway to determine capabilities and limitations of air movement of containers. This includes a major revision of air transportability concepts, testing of current land-sea containers to determine air movement procedures, and design and development of tri-mode containers. Much of the results of these efforts will help mold air cargo movement of the future. (Author)

**A73-43494** # Economics of airport system planning. J. A. Neiss (Aerospace Corp., Los Angeles, Calif.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-33*. 8 p. Members, \$1.00; nonmembers, \$3.00.

An airport system plan generally defines the developmental needs and requirements that are necessary to meet five-, ten-, and twenty-year aeronautical activity forecasts. Unfortunately, these system plans do not adequately address or meet the current economic needs of many of the nation's airports with respect to economics of operation, ownership, and finance. An analysis is made of the economics of airport operation, ownership, and finance, and the economic criteria that should be integrated into airport system planning to produce a viable plan are indicated. (Author)

**A73-43495** # Reducing the threat of mid-air collisions. T. M. Johnston (FAA, Technical Programs Div., Washington, D.C.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-49*. 7 p. Members, \$1.00; nonmembers, \$3.00.

A much discussed but poorly understood problem, associated with air travel, is the threat of midair collision by the ever-increasing number of planes utilizing the air space over the United States. This problem is put in the proper perspective, and current efforts by Government and industry to advance the state-of-the-art in collision avoidance systems and to develop a timely solution to the midair collision problem are discussed. (Author)

**A73-43496** # Dual lane runway issues. J. C. Koegler (MIT, Lexington, Mass.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-61*. 13 p. 5 refs. Members, \$1.00; nonmembers, \$3.00.

The issues involved in the design and operation of dual-lane runways are discussed. Dual-lane runway questions were investigated via fast-time and real-time simulations at Lincoln Laboratory over the period from October 1971 to December 1972. Included is an overview of the critical issues and findings identified with dual-lane runway configuration and operation. (Author)

**A73-43497** # The role ground transportation can play in the airport site selection process. N. F. McGinnis (TRW, Inc., Washington, D.C.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-70*. 17 p. Members, \$1.00; nonmembers, \$3.00.

Significant aspects of the mass transit system analysis activity associated with the recent South Florida Airport Site Selection

Program are discussed. The configuration, performance, cost, and service characteristics of the quasi-conceptual ground access transportation systems continually represented one of the main decision factors as the review authorities deliberated on each candidate airport site. Discussion of the transportation system impact on these deliberations is essentially the prime objective of this presentation.

(Author)

**A73-43498 \* #** Some considerations for air transportation analysis to non-urban areas. S. D. Norman (NASA, Ames Research Center, Systems Studies Div., Moffett Field, Calif.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-72*. 6 p. 6 refs. Members, \$1.00; nonmembers, \$3.00.

Review of some of the problems associated with air transportation to and from nonurban areas. While a significant proportion of public transportation needs of nonurban areas are met by aircraft, there are indications that improvement in air transportation service are called for and would be rewarded by increased patronage. However, subsidized local service carriers are attracted by large aircraft operation, and there is a tendency to discontinue service to low density areas. Prospects and potential means for reversing this trend are discussed.

M.V.E.

**A73-43499 \* #** Potential of hydrogen fuel for future air transportation systems. W. J. Small, D. E. Fetterman, and T. F. Bonner, Jr. (NASA, Langley Research Center, Hampton, Va.). *Intersociety Conference on Transportation, 2nd, Denver, Colo., Sept. 23-27, 1973, ASME Paper 73-ICT-104*. 11 p. 26 refs. Members, \$1.00; nonmembers, \$3.00.

Recent studies have shown that hydrogen fuel can yield spectacular improvements in aircraft performance in addition to its more widely discussed environmental advantages. The characteristics of subsonic, supersonic, and hypersonic transport aircraft using hydrogen fuel are discussed, and their performance and environmental impact are compared to that of similar aircraft using conventional fuel. The possibilities of developing hydrogen-fueled supersonic and hypersonic vehicles with sonic boom levels acceptable for overland flight are also explored.

(Author)

**A73-43520 #** The future for STOL. R. E. Hage and M. D. Marks (Douglas Aircraft Co., Long Beach, Calif.). *RAeS, AIAA, and CASI, Anglo-American Aeronautical Conference, 13th, London, England, June 4-8, 1973, Paper, 6 p.*

Technology developments which are important for the future of short takeoff and landing aircraft in the high-density air transport system are examined. The developments relate to the relief of major airport congestion and community acceptance of satellite short-haul airports. A system evaluation is discussed together with the technology base. Attention is given to the high lift system, handling qualities, the functions of the stability augmentation system, aspects of airfoil design, problems of acoustics, and questions of operating economics.

G.R.

**A73-43720 #** A generalization of thin foil theory (Ob odnom obobshchenii teorii tonkogo profilja). I. L. Goloborod'ko and I. V. Ostoslavskii. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 19-23. In Russian.

Description of a method of determining the aerodynamic characteristics of a slightly bent thin foil in the case of an arbitrarily located flow separation point. The problem is solved on the basis of thin foil theory. Analytical expressions are obtained for determining the lift coefficient and the longitudinal moment of the foil, and a study is made of the effect of the location of the flow separation point on the values of these two parameters.

A.B.K.

**A73-43722 #** The effect of walls on the lifting force of a solid-foil wing (Vliianie stenok na pod'emnuu silu kryla telesnogo

profilja). V. N. Kravets. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 29-33. 7 refs. In Russian.

Consideration of the motion of a wing in a bounded ideal incompressible two-dimensional fluid flow. It is shown that if the perturbations introduced into the flow by the wing are small, a fairly general theory concerning this motion can be developed with the aid of the acceleration potential method. The solution of the singular integral equations to which this method leads can be simplified by using the asymptotic method of functional parameters. Curves showing the variation of the influence function for specific foil configurations are presented.

A.B.K.

**A73-43723 #** Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method (K opredeleniiu progibov i napriazhenii v kryle malogo udlineniia metodom peremeshchenii). P. D. Levashov. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 34-39. In Russian.

Description of a method of obtaining a system of resolvent equations for determining the deflections of the middle plane of a thin-walled small-aspect-ratio wing. The proposed method is similar in form to the Ritz method but differs from it in that the values of the node deflections are taken directly as the unknowns. The boundary kinematic conditions in the root cross section are satisfied by solving a conditional-extremum energy-minimization problem. The system of resolvent equations for the deflections is simple to derive, and the calculation of the coefficients of the unknowns can be easily programmed.

A.B.K.

**A73-43724 #** Calculation of the deformations of a propeller blade in flight (Raschet deformatsii lopasti vozdushnogo vinta v polete). A. Iu. Liss. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 40-45. 9 refs. In Russian.

Development of a method of calculating the in-flight deformations of a propeller blade with allowance for bending in two planes and torsion. The proposed method is based on an expansion of the deformations in powers of the blade eigenmodes, followed by a determination of the deformation coefficients with the aid of the Galerkin method. In addition, a method of allowing for a nonlinear damper mounted on a vertical hinge is also proposed, as well as a method of allowing for the variability of the blade setting angle with respect to azimuth.

**A73-43725 #** Study and calculation of the vibrations of a rotating rotor with allowance for clearances in the bearings (Issledovanie i raschet kolebaniy vrashchaiushchegosia rotora s uchedom zazorov v oporakh). Iu. M. Klimov. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 46-52. 6 refs. In Russian.

Consideration of the problem of calculating the nonlinear vibrations of elastically deformable rotors of gas turbine engine compressors and turbopump units with allowance for radial clearances in the bearings. The equations describing the forced vibrations of such a rotor are derived, and an approximate analytical method of solving them is proposed. The results of theoretical and experimental studies of the effect of clearances and rotor imbalance on the excitation of parametric vibrations are presented. Recommendations are made regarding the elimination of dangerous resonances so as to improve the reliability of the machines.

**A73-43728 #** Designing a slender-wing-type cantilever plate under conditions of unsteady creep (Raschet konsol'noi plastiny tipa tonkogo kryla v usloviakh neustanovivsheisia polzuchesti). V. G. Shataev. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 66-71. 7 refs. In Russian.

**A73-43733 #** Thermodynamics of an air-cooled gas-turbine stage (K termodinamike stupeni gazovoi turbiny s vozdushnym okhlazhdeniem). E. N. Bogomolov. *Aviatsionnaia Tekhnika*, vol. 16, no. 2, 1973, p. 97-106. In Russian.

Formulas are derived for calculating the efficiency and other principal parameters of a gas-turbine stage with air-cooled nozzle ring and rotor. The formulas are valid in the case where the cooling air is fed into the air-gas flow area. Quantitative estimates of the enthalpy drop in the rotor and other thermodynamic effects are obtained from example computations. V.P.

**A73-43735 #** Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods (K zadache o kolebaniyakh detalei TRD, soderzhashchikh konstruktivnyye dempfery tipa sloynnykh sterzhnei). A. A. Samarin. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 111-115. In Russian.

The problem of determining the dissipation of the vibrational energy in a two-layer rod of arbitrarily varying cross section is examined. The layers are pressed together by a force that varies along the rod's length. The interface is governed by Coulomb's dry friction law. Inertia forces are taken into account. An expression for calculating the mutual slipping of the layers is derived for the case of phased vibrations of the layers. V.P.

**A73-43736 #** Classification of methods for solving the direct problem of axisymmetric flow calculation in turboengines (O klassifikatsii metodov resheniya priamoi zadachi rascheta osesimmetrichnogo potoka v turbomashinakh). A. M. Topunov and R. D. Iosifov. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 116-121. 33 refs. In Russian.

**A73-43740 #** Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades (O vliyaniy okruzhnoi neravnomernosti temperatur-nogo polia pored turbinoi na vibronapriazhennost' rabochikh lopatok). N. A. Gachegov and V. D. Ronzin. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 131-135. In Russian.

**A73-43741 #** The problem of extrapolating test data on the efficiency of turbine-blade cooling to actual conditions (K voprosu pereneseniya rezul'tatov opytov po effektivnosti okhlazhdeniya turbinnykh lopatok na naturnye usloviya). V. I. Lokai and A. S. Limanskii. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 135-143. 10 refs. In Russian.

Lokai's (1970) formulas for extrapolating cooling efficiency to actual high-altitude conditions are verified experimentally, using a gasdynamic test stand and longitudinally cooled turbine blades. The need for careful study of the heat transfer in the cooling channels of rotating blades is demonstrated. V.P.

**A73-43742 #** Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine (O sovmestnoi rabote ob'omnogo i lopatochnogo nasosov v kachelushchem agregate maslosistemy VRD). V. A. Rakhaf'skil. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 144-147. In Russian.

The efficiency of two versions of a jet-engine high-speed oil delivery system is analyzed and compared. One system consists of a vane booster pump which supplies the oil to a conventional positive-displacement gear pump, and whose rpm's may be higher than those of the gear pump. The other system uses a common shaft to drive a gear and centrifugal impellers mounted in front of the gear. It is shown that the first system is the more efficient one. It provides synchronous operation over the entire range of rpm's. Maximum-power altitude is limited only by the cavitation parameters of the vane pump. V.P.

**A73-43743 #** Utilization of semiartificial thermocouples in gas-turbine engine tests (K voprosu primeneniya poluiskusstvennykh termopar pri ispytaniyakh gazoturbinnykh dvigatelei). D. F. Sim-

birskii, L. S. Grigor'ev, A. Ia. Anikin, and L. O. Miroshnichenko. *Aviatsionnaya Tekhnika*, vol. 16, no. 2, 1973, p. 148-150. In Russian.

Thermocouples, one of whose wires was prepared from the same metal as the component studied, were used to determine the temperature fields in combustion-chamber casings, disks, and blades of gas turbine engines. It is found that the use of such 'semiartificial' thermocouples diminishes the distortion of the temperature fields. The thermoelectric properties of a number of heat-resistant alloys are studied at temperatures of up to 1200 C. V.P.

**A73-43809** Fatigue crack growth retardation after single-cycle peak overload in Ti-6Al-4V titanium alloy. R. E. Jones (Dayton, University, Dayton, Ohio). *Engineering Fracture Mechanics*, vol. 5, Sept. 1973, p. 585-604. 13 refs.

**A73-43811** Environmental effects on fracture resistant and biaxial fatigue design of aircraft structures. U. G. Goransson and D. D. Froerer (Boeing Co., Seattle, Wash.). (*Symposium on Fracture and Fatigue, George Washington University, Washington, D.C., May 3-5, 1972.*) *Engineering Fracture Mechanics*, vol. 5, Sept. 1973, p. 627-645. 10 refs.

Discussion of the two interrelated fields of crack initiation and crack propagation, presenting analytical techniques for calculating fatigue damage in biaxially stressed structures along with determinations of safe inspection intervals for contained crack growth. The equivalent stress concept is used to derive a set of uniaxial stresses that produce the same amount of fatigue damage as the biaxial stress exposure. The distortion energy concept serves as the basis for combining alternating principal stresses by translating the uniaxial SN curves for zero mean stress into a family of concentric ellipses. Empirical procedures are given for treating problems with varying principal stress directions and areas with directionally dependent fatigue performance. The Goodman diagram relates alternating stresses and mean stresses at any constant cyclic life. If two uniaxial Goodman diagrams are constructed on each reference axis, a three-dimensional body can be visualized which intercepts the zero alternating stress plane in a shape identical to that described by the applicable static load criterion. (Author)

**A73-43813 \*** Fracture analysis of surface- and through-cracked sheets and plates. J. C. Newman, Jr. (NASA, Langley Research Center, Hampton, Va.). (*Symposium on Fracture and Fatigue, George Washington University, Washington, D.C., May 3-5, 1972.*) *Engineering Fracture Mechanics*, vol. 5, Sept. 1973, p. 667-689. 33 refs.

The Neuber stress-concentration relation for notches in an elastic-plastic material subjected to shear loading was generalized for a crack in a finite plate subjected to tensile loading. An equation was derived which related the linear elastic stress-intensity factor, the applied stress, and two material parameters. The equation was then used as a two-parameter fracture criterion for surface- and through-cracked specimens. Fracture data from the literature on surface- and through-cracked sheet and plate specimens of steel, titanium alloy, titanium weldment, and aluminum alloy tested at room and cryogenic temperature were analyzed according to the proposed equation. For surface cracks, wide ranges of crack-depth to crack-length ratio and crack-depth to specimen-thickness ratio were considered. For through cracks, wide ranges of crack length and specimen width were also considered. (Author)

**A73-43859** Meridional distribution of tropospheric ozone from measurements aboard commercial airliners. H. K. Tiefenau, P. G. Pruchniewicz, and P. Fabian (Max-Planck-Institut für Aeronomie, Lindau über Northeim, West Germany). (*Symposium on Atmospheric Ozone, Arosa, Switzerland, Aug. 21-25, 1972.*) *Pure and Applied Geophysics*, vol. 106-108, no. 5-7, 1973, p. 1036-1040. Research supported by the Deutsche Forschungsgemeinschaft.

**A73-43911** Present status and development trends in the processing of titanium (Stand und Entwicklungstendenzen der Titanverarbeitung). H. Kellerer and G. Gans (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). (Universität Erlangen-Nürnberg, Hauskolloquium, 3rd, Erlangen, West Germany, Oct. 12, 1972.) *Zeitschrift für Metallkunde*, vol. 64, Sept. 1973, p. 606-612. 11 refs. In German.

Metal-physical parameters strongly influence the technology of fabrication of titanium alloys: hexagonal structure, high strength at low Young's modulus, Bauschinger effect, high affinity to oxygen, stable oxides, susceptibility to hydrogen embrittlement, stress corrosion cracking by halogens, and low thermal conductivity. Techniques of fabrication are described which serve to overcome these problems in aeronautic and space applications: hot forming - e.g., by creep and relaxation deformation, shaping by chemical means and spark cutting, electron beam and diffusion welding under vacuum, stress relaxation annealing, special quenching media, and coating and hardening of surfaces. Moreover, unsolved problems - e.g., problems regarding techniques and heat treatments - are discussed. (Author)

**A73-44000** Aluminum brazed titanium honeycomb sandwich structure - A new system. S. D. Elrod, D. T. Lovell, and R. A. Davis (Boeing Co., Seattle, Wash.). (American Welding Society and Welding Research Council, International Brazing Conference, 4th, Chicago, Ill., Apr. 4, 5, 1973.) *Welding Journal, Research Supplement*, vol. 52, Oct. 1973, p. 425-s to 432-s.

The results of a development and production scale-up program for an Al-brazed Ti honeycomb sandwich structure are summarized, covering tests results for corrosion resistance, creep, metallurgical stability, mechanical strength, and fracture toughness. Creep-rupture tests were conducted at 450, 600 and 800 F. The corrosion tests included aircraft service of about three years, laboratory salt spray tests, and electric-potential measurements. The flatwise tension creep-rupture strength was adequate for structural applications of 800 F. The corrosion resistance was essentially equivalent to that of 3033 aluminum sheet. The production process is evaluated positively for 800 F operation, wedge and acoustic panel designs, and panel configurations for 30,000 lb/in. Cost analysis shows that the structure is economically feasible for high performance vehicles. V.Z.

**A73-44025** The effect of composition changes on the fracture toughness of an Al-Zn-Mg-Cu-Mn forging alloy. C. J. Peel and P. J. E. Forsyth (Royal Aircraft Establishment, Materials Dept., Farnborough, Hants., England). *Metal Science Journal*, vol. 7, July 1973, p. 121-127. 15 refs.

**A73-44052** Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 420 p.

Aspects of FAA certification flight testing are discussed together with details of Army flight test program management, the management of Air Force test and evaluation activities, the flight test programs of the Naval Air Systems Command, the management of commercial flight test programs, and the control of flight test programs at Bell Helicopter Company. The role of a military flight test engineer in test management and the capabilities of government test facilities are considered.

G.R.

**A73-44053** # Management and control of flight test programs of the Western Region FAA. C. E. Richards (FAA, Aircraft Engineering Div., Los Angeles, Calif.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 30 p.

The mission performed by the Aircraft Engineering Division of the Federal Aviation Administration (FAA) is considered. As a service organization, the Aircraft Engineering Division influences the management and planning of a manufacturer's test program but does not directly manage it. Basically, the Aircraft Engineering Division certifies the aircraft which use the airports and airways. The specialties involved in certifying a modern complex aircraft are examined. The certification requires a close coordination of the Manufacturing Inspection Branch, the Airframe Branch, the Systems and Equipment Branch, the Propulsion Branch, and the Flight Test Branch. Questions regarding the general philosophy behind the certification program are discussed and sample pages from a typical flight test program are provided.

**A73-44054** # Management and control of flight test programs at U.S. Army Aviation Systems Command. C. C. Crawford, Jr. (U.S. Army, Washington, D.C.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 28 p.

Organizational questions are considered, giving attention to the Contractor's Development and Airworthiness Qualification Program. The tests are done entirely by industry and witnessed to varying extents by Army technical specialists. Specifications are provided to industry regarding the tests required to convince the Army that the aircraft is in fact airworthy. Tests carried out by industry are supplemented with tests conducted by the Army within the framework of an Army Preliminary Evaluation (APE). The APE's are generally short two week evaluations. A typical program would involve one APE early for performance assessment. Other investigations include a flying qualities evaluation and an evaluation of key subsystems on the aircraft. These tests are followed by endurance tests, flight characteristics tests, climatic laboratory tests, and a service test.

**A73-44055** # Management of Air Force test and evaluation activities. J. P. Streit (USAF, Systems Command, Andrews AFB, Washington, D.C.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 51 p.

The Air Force manages a wide variety of testing activities beginning with such tasks as the examination of the smallest pieces or components undergoing environmental or qualification testing and extending to the assessment of the relative effectiveness of different tactical applications of entire new weapon systems. In addition, there are other testing programs related to basic research and technology advancement. The current Air Force test and evaluation (T and E) management concepts are discussed, giving attention to the evolution of these concepts in the period since about 1967. The total Air Force test and evaluation work effort is now divided into three broad classes, including R and D T and E, acquisition T and E, and engineering services T and E.

**A73-44056** # Management and control of flight test programs of the Naval Air Systems Command. F. H. Baughman (U.S. Naval Air Systems Command, Washington, D.C.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 17 p.

The planning and setting up of a flight test program for a major Navy weapons systems development are discussed, giving attention to Navy project manager reporting relationships. The S-3A Viking contractor flight test program considered consists of three interlocking phases, including a detailed laboratory test integration and evaluation program. The second phase, the flying test bed, is an intermediate step between the laboratory and aircraft tests. The third phase is the normal aircraft flight test program itself. Questions of avionics development and testing are explored together with aspects of the S-3A initial operational test and evaluation.

G.R.

**A73-44057 # Management and control of commercial flight test programs.** H. W. Zimmerman (Boeing Co., Flight Operations Dept., Seattle, Wash.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 33 p.

The historical evolution of commercial flight test programs is discussed, giving attention to advances occurring in response to the changes which took place since 1963 in the commercial transport market. Various aspects regarding the development of the Boeing 747 are considered, taking into account special design problems and aerodynamic testing conducted with the aid of an onboard electronic calculator. Questions of specific program responsibilities are investigated. Details of aircraft control are discussed together with the responsibilities of the product division, the technology staff of the group engineering, and the flight operations department. The manufacturing preflight is considered along with the results of the Boeing 747 flight test program. G.R.

**A73-44058 # Management and control of military and commercial flight test programs at Bell Helicopter Company.** R. H. Wheelock (Bell Helicopter Co., Fort Worth, Tex.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 13 p.

Problem areas which have to be investigated are related to torsional stability, power management, fuel control characteristics, preflight ground endurance, components fatigue life, static and dynamic stability of the machine, cooling, and throttle response. Aspects of management procedures are considered, taking into account general technical measurements, instruction influence, data management, and cost-time schedule performance. Questions of instrumentation are discussed together with approaches for the efficient evaluation of test data. The responsibilities of various experts involved in the analysis of the test are examined. Attention is given to cost-schedule performance control methods designed to avoid major cost overruns in the development of the aircraft. G.R.

**A73-44059 # Management and control of military flight test programs at McDonnell Douglas.** St. Louis, Missouri. R. L. Tuttle (McDonnell Douglas Corp., St. Louis, Mo.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 26 p.

A contractor must thoroughly understand the objective of the weapon system and must design and test it for the most probable critical service environments. Testing requires sound management techniques. Basic considerations peculiar to test program management are discussed. In the development phase, fatigue testing will investigate the life of the system. The various phases of flight testing are described. Questions of test effectiveness are examined along with test program plans and requirements of test support. G.R.

**A73-44060 # SFTE Symposium 12 October 1972.** F. G. Edwards (Grumman Aerospace Corp., Bethpage, N.Y.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 52 p.

A number of basic questions regarding the objectives of flight tests are examined, giving attention to the responsibility to the customer, obligations to the corporation, and organizational relations. A flight test system was developed through the integration of five elements, including detailed planning, advanced test techniques, supporting facilities, integrated flight operations, and control. The heart of the flight test system is an Automated Telemetry Station (ATS). ATS test operations are discussed together with ATS real time benefits, integrated flight operations, budget considerations, and plans for improvements. G.R.

**A73-44061 # Air Force Prototype Program management.** R. E. Whelan (USAF, Prototype Program Office, Wright-Patterson AFB, Ohio). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 34 p.

The Charter of the AF Advanced Prototype Program Office basically delineates a low cost advanced development effort for the development of advanced prototype aircraft and subsystems for technical evaluation against anticipated operational needs. The factors which characterize adaptive management as applied to advanced prototype programs are discussed. The prototype program concept is considered together with questions of prototype program office organization, the responsibilities of Air Force and other government agencies, aspects of program control, engineering, procurement/financial management, and logistics. The lightweight fighter prototype project is examined as one of the major programs to result from the prototype study. G.R.

**A73-44062 # The role of a military flight test engineer in test management.** J. K. Potts (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 16 p.

Test and evaluation is the single largest task of the Air Force Systems Command. The Air Force flight test engineer has the background to play an important role in flight test management beyond the actual testing operations. The flight test engineer at the Air Force Flight Test Center is not a specialist. He reads film, prepares test plans, develops data reduction routines, flies in the test aircraft and plots and analyzes the test data. If he demonstrates the necessary competence he will become a project engineer responsible for an entire flight test program. After one or two major projects the project engineer will become a flight test manager at the test center level. The genesis of an engineering development program is discussed, giving particular attention to the role of the flight test manager. G.R.

**A73-44063 # NAFEC test facilities.** R. M. Spangler (FAA, National Aviation Facilities Experimental Center, Atlantic City, N.J.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 27 p.

Technical data are presented regarding the functions and capabilities of the test-bed, service, and commissioned facilities at the National Aviation Facilities Experimental Center (NAFEC), Atlantic City, New Jersey. The background of NAFEC is discussed together with the range instrumentation environment, the navigational aids environment, the communications environment, the ATC systems laboratory environment, the service facilities environment, the aircraft safety environment, the aircraft environment, the airport environment, and the computation environment. Other subjects considered include the magnetic tape data acquisition systems, the flight simulation facility, and the vortex measurement facility. G.R.

**A73-44064 # The capabilities of army test facilities.** S. G. Cockerham (U.S. Army, Washington, D.C.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 55 p.

The Army test capabilities which are dedicated to aircraft testing are discussed, giving attention to the people, the locations, and the equipment which provide these capabilities. Questions of organizational relations are considered. The Aviation Systems Command is responsible for aircraft procurement, engineering, engineering flight tests, and logistics support. The Test and Evaluation Command tests and evaluates all Army Materiel Command material

with the exception of aircraft. Important installations include the Electronic Proving Ground, the Yuma Proving Ground, the Tropic Test Center, and the Central Ground Station. G.R.

**A73-44066 #** Remarks before the Third National Symposium Society of Flight Test Engineers 13 September 1972. R. M. Isaman (U.S. Naval Air Test Center, Patuxent River, Md.). In: Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. California, Md., Society of Flight Test Engineers, 1973. 12 p.

The Navy's capabilities for the test and evaluation of aircraft are examined, giving attention to organizational relationships. The Naval Civil Engineering Laboratory, the Naval Electronics Laboratory Center, the Naval Ordnance Laboratory, and the Naval Undersea Center are oriented along technology lines. The Naval Air Development Center and the Naval Ship Research and Development Center are concerned with associated technologies such as the materials, structures, fluid dynamics, and control problems of aircraft and ships. The Naval Weapons Laboratory and the Naval Weapons Center are focused on surface warfare, air warfare, and air-launched weapons. G.R.

**A73-44155 #** On the process of precipitation in Mg-Ce alloy. G. Omori, S. Matsuo (National Research Institute for Metals, Tokyo, Japan), and H. Asada (Nihon University, Chiba, Japan). *Japan Institute of Metals, Journal*, vol. 37, July 1973, p. 677-682. 17 refs. In Japanese, with abstract in English.

The precipitation process in Mg-1.3 wt % Ce alloy was studied by means of electrical resistivity measurement and electron microscopy. On isochronal annealing of the alloy, the electrical resistivity decreased gradually up to about 200 C, followed by an abrupt decrease between 200 and 325 C. This abrupt decrease was attributed to the precipitation of an intermediate phase. On further heating, the electrical resistivity increased steadily, but the increase halted temporarily at 450 to 500 C. At this stage, the precipitation of the equilibrium phase was observed. On isothermal annealing in the temperature range from 100 to 150 C, the electrical resistivity decreased in two stages. Following Johnson-Mehl equation, the values of 2/3 and 1.0 were obtained as the time exponents,  $n$ , for the first and second stage, respectively. Using the isothermal curves of resistivity change, estimations of apparent activation energies for the above two stages were also made. (Author)

**A73-44219** Measuring technological change - Aircraft turbine engines. A. J. Alexander and J. R. Nelson (Rand Corp., Santa Monica, Calif.). *Technological Forecasting and Social Change*, vol. 5, no. 2, 1973, p. 189-203. 5 refs.

A technique for measuring technological change is discussed, giving attention to the definition of a breakthrough and the meaning of the phrase that a device is ahead of its time. The analysis conducted is confined to the development process. It proceeds on the assumption that the device under development can be adequately characterized by a limited number of parameters. The increase in the value of the parameter set is called technological advance. Basic research and invention are excluded. American aircraft turbine engines are selected as the initial subject for testing the new technique. A statistical analysis of a data sample on turbine engines is performed. The analysis of technological change is extended to take into account additional factors. Thus, a technological production function is defined. The function relates the technology and production costs to the resources or costs of development. G.R.

**A73-44223 \* #** The many uses of the dirigible. J. R. Hunt (Embry-Riddle Aeronautical University, Daytona Beach, Fla.), B. B. Levitt (Operations Research, Inc., Silver Spring, Md.), F. Morse (Boston University, Boston, Mass.), K. R. Stehling (NASA,

Washington, D.C.), and J. G. Vaeth (NOAA, National Environmental Satellite Service, Washington, D.C.). *Astronautics and Aeronautics*, vol. 11, Oct. 1973, p. 58-65. 6 refs.

Prospects for a revival of large airships are based on a number of unique services which can be provided by the dirigibles. It is shown that airships are not unduly weather-sensitive. Modern technological advances will give the airship of the future operational features which will be greatly superior to those of the Zeppelins of the past. Projections set the payload of a 22-million-cu ft conventionally propelled airship of conservative design at 615,000 lb for a range of 2950 mi. The corresponding figure for the C-5A aircraft is only 265,000 lb. Dirigibles could, therefore, become merchant ships of the air, carrying low-density and large-dimension cargoes that jet freighters find economically unattractive or practically impossible to handle. The absence of landing-facility requirements would make the airship a logical candidate for introducing trade into otherwise inaccessible regions of the world. G.R.

**A73-44292 #** Errors produced by the influence of unsteady heating in strain measurement by wire-type resistance strain gages (Pogreshnost' v izmerenii deformatsii provolochnymi tenzorezistorami, obuslovlennaya vliyaniem nestatsionarnogo nagreva). A. N. Ser'eznov and G. A. Tsareva. *Problemy Prochnosti*, vol. 5, Aug. 1973, p. 85-87. 7 refs. In Russian.

**A73-44294 #** Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators (Opredelenie polei temperatur diskov i lopatok turbin indikatorami iz obluchennogo almaza). E. F. Barbashin, K. S. Pul'kis, and V. A. Nikolaenko. *Problemy Prochnosti*, vol. 5, Aug. 1973, p. 117-119. In Russian.

The method proposed is based on the property of a crystalline diamond to increase the volume of the crystal lattice under bombardment by high-energy particles, and to gradually decrease the volume to the initial size under the effect of heating. The method provides an effective means of monitoring turbine temperatures in the temperature range from 130 to 1200 C. V.P.

**A73-44329** Determinate systems on modal control theory. T. P. Grigor'eva and L. I. Kozhinskaia. (*Avtomatika i Telemekhanika*, Apr. 1973, p. 5-8.) *Automation and Remote Control*, vol. 34, no. 4, Sept. 1, 1973, pt. 1, p. 513-516. Translation.

Consideration of the problem of synthesizing a linear control system with a desired spectrum on the basis of incomplete information regarding this system. Necessary and sufficient conditions are obtained under which a closed-loop linear control system possesses a desired spectrum and the information vector of the system has a minimum dimension. A.B.K.

**A73-44377 #** Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers. C. A. Fisher and C. W. Bert (Oklahoma, University, Norman, Okla.). (*Canadian Congress of Applied Mechanics, 4th, Montreal, Canada, May 28-June 1, 1973.*) *ASME, Transactions, Series E - Journal of Applied Mechanics*, vol. 40, Sept. 1973, p. 736-740. 19 refs.

As an exploratory effort toward improving the crashworthiness of light aircraft cabins, a theoretical analysis was made to predict the dynamic buckling load and buckling time of a stiffened, thin-walled circular cylindrical shell. To provide for the large stiffener spacing in light aircraft, the stiffeners were considered as discrete elements by means of a Dirac delta procedure. The nonlinear governing equations were derived using Hamilton's principle and the final equations were obtained by means of Galerkin's method. Solution was carried out by using a Gauss-Jordan technique on the algebraic equations and a Runge-Kutta technique on the nonlinear differential equations. Numerical results are presented for an idealized model of a typical light aircraft cabin. (Author)

**A73-44575** The transatlantic charter policy of the United States. L. S. Keyes. *Journal of Air Law and Commerce*, vol. 39, Spring 1973, p. 215-248. 81 refs.

In 1972, the governments of both the U.S. and the UK abandoned longstanding restrictive attitudes toward the air transportation of passengers by charter carriers and by charters operated by scheduled carriers. The early policy of extreme caution on the part of the U.S. toward independent international charter air carriage is considered together with the change in policy and its impact on IATA fares. Questions of the expansion of charter traffic and the renewal of certificates are examined. Recent moves towards liberalization are discussed, giving attention to the disapproval of resolution 045, the adoption of nonaffinity charter regulations, and efforts to regularize charter landing rights. G.R.

**A73-44690** The aerodynamics of aircraft and other things /Fifteenth Lanchester Memorial Lecture/. P. R. Owen (Imperial College of Science and Technology, London, England). *Aeronautical Journal*, vol. 77, Aug. 1973, p. 383-405. 65 refs.

A review of some basic problems of aircraft aerodynamics, including the author's contributions to the field. Among the topics covered are the slender body theory, the responses of airships and buildings to atmospheric turbulence, boundary layers vs atmospheric turbulence, wind tunnel contractions, grids and boiler tubes as turbulence agents, aircraft radiator blocks, and various types of vortex-induced oscillations. Rough surfaces and sand storms, wind tunnel simulation, laminar flows, turbulent-to-laminar flow transition in the human lung, and a hypersonic flow past a blunt body are also considered. V.Z.

**A73-44692** On problems of flight over an extended angle-of-attack range. H. H. B. M. Thomas (Royal Aircraft Establishment, Farnborough, Hants., England). *Aeronautical Journal*, vol. 77, Aug. 1973, p. 412-423. 53 refs.

An attempt is made at providing a basis for the preparation of brief background leaflets as supplements to airworthiness requirement statements, with particular attention to adequate high lift performance and safe post-stall flight control of the aircraft. The topics include design features affecting aircraft performance under limiting angle-of-attack conditions, lateral forces and moments, interactions between wind and various aircraft components, control effectiveness, and buffeting. The needed wind tunnel tests and flight dynamics analysis at and beyond critical conditions are considered. V.Z.

**A73-44695** F-14. M. Wilson. *Flight International*, vol. 104, Sept. 27, 1973, p. 508-517.

The F-14 Tomcat is intended to replace the Phantom. The aircraft is to be used for escort missions, fleet defense, interdiction, and close support. The top speed called for is a little over Mach 2.2, permitting the use of conventional aluminum-based alloys. By the refuelling technique F-14s can be kept airborne for periods from 4 to 8 hrs, limited only by crew fatigue. Structurally the Tomcat is significant in being the first Western aircraft designed to use composite materials for load-bearing applications. G.R.

**A73-44702** # Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel (O kusochno-odnometrykh modeliyakh sverkhzvukovogo goreniia i psevdoskachka v kanale). E. S. Shchetnikov. *Fizika Goreniia i Vzryva*, vol. 9, July-Aug. 1973, p. 473-483. 15 refs. In Russian.

Analysis of the phenomenon of thermal cutoff which limits a one-dimensional heat input to a supersonic flow in a cylindrical channel. It is found that thermal cutoff of a supersonic flow occurs according to different mechanisms in long and short pipes. In long pipes with a developed boundary layer combustion occurs in the presence of a pseudoshock, while in short pipes no pseudoshock is formed. In the case of supersonic combustion in a long pipe it is

shown that a one-dimensional calculation of the flow parameters from the measured wall pressure leads to contradictory results in regimes far from thermal cutoff. A calculation of the parameters of a supersonic flame jet from the measured wall pressure in the case of the two-stream Crocco model also leads to contradictory results. Results which are physically more justifiable are obtained for a separation model which assumes the presence of separation zones in the flow. The separation model also makes it possible to give a quantitative description of the flow in an isothermal pseudoshock.

**A73-44827** # Supersonic jet noise generated by large scale disturbances. C. K. W. Tam (Florida State University, Tallahassee, Fla.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-992*. 14 p. 22 refs. Members, \$1.50; nonmembers, \$2.00. NSF Grant No. GK-35790.

A number of experimental evidence and theoretical arguments are now available to suggest that the dominant part of supersonic jet noise is produced by orderly large scale disturbances in the jet flow. This paper presents a mathematical theory which predicates the total noise power and its directional distribution of a nearly ideally expanded supersonic jet generated by this process. Supersonic jet flows are highly unstable. The amplified large scale disturbances of the flow not only enhance the unsteady entrainment of ambient gas into the jet, but also cause the jet to vibrate laterally. Both of these phenomena result in the emission of acoustic waves to the ambient environment. Numerical calculations on a Mach 2.2 cold supersonic jet based on the present theory compare favorably with experimental measurements. (Author)

**A73-44829** # Acoustic fatigue resistance of aircraft structures at elevated temperatures. C. W. Schneider (Lockheed-Georgia Co., Marietta, Ga.) and F. F. Rudder (Acoustics and Vibration Associates, Inc., Smyrna, Ga.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-994*. 9 p. 11 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. F33615-72-C-1141.

An analytical and experimental program was conducted to develop acoustic fatigue design criteria for aircraft structures subjected to intense noise in a high temperature environment. Equations for the dynamic response of a buckled panel were formulated for simply supported and clamped boundary conditions using large deflection plate theory. Random amplitude acoustic fatigue testing of representative aircraft structure was accomplished at temperatures up to 600 F to provide data for correlation with the analytical results. Empirical design criteria are presented in the form of design equations and nomographs for predicting the thermal and dynamic response of aircraft structures subjected to combined environments. **A73-44834** \* # Subsonic and supersonic jets and supersonic suppressor characteristics. H. T. Nagamatsu and R. E. Sheer, Jr. (GE Research and Development Center, Schenectady, N.Y.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-999*. 25 p. 36 refs. Members, \$1.50; nonmembers, \$2.00. NASA-FAA-supported research.

The flow and acoustic characteristics over a Mach number range of 0.6 to 1.5 were determined for convergent and parallel flow nozzles with room temperature air. Mean velocity and fluctuating impact and static pressure distributions were investigated. Near- and far-field acoustic measurements were obtained, and overall sound power levels were compared with subsonic theory of Lighthill and supersonic theory of Nagamatsu and Horvay. Flow and acoustic characteristics of single and multiple shroud supersonic suppressors were studied. With 191 tubes and shrouds the overall sound power level for a Mach 1.4 jet was reduced 15.3 and 20.5 db respectively.

**A73-44836 \* #** Jet noise suppression by swirling the jet flow. I. R. Schwartz (NASA, Ames Research Center, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1003*. 8 p. 6 refs. Members, \$1.50; nonmembers, \$2.00.

The effect of swirling flow on jet noise suppression was experimentally investigated in a relatively small, low-thrust, fan-jet engine. Measurements of acoustic properties of the near and far fields, jet-flow characteristics, and engine thrust were made with and without stationary swirl vanes installed in the primary exhaust nozzle. Preliminary test results indicate that substantial reductions in jet overall sound pressure levels and overall acoustic power were obtained with minimal thrust losses. Based on preliminary analysis, present results, and previous experiments with swirling hot jets, it is predicted that even greater jet noise reductions can be obtained in higher thrust engines, particularly with afterburning, by swirling jet exhaust. (Author)

**A73-44838 \* #** A theoretical and experimental study of sound attenuation in an annular duct. H. E. Plumblee (Lockheed-Georgia Co., Marietta, Ga.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1005*. 12 p. 8 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS1-10472.

The flow duct used in the experiments for this study was described in an earlier paper by Plumblee and Dean (1972). Angular and radial standing modes were excited in isolation, and the modal attenuation and phase speed were measured in an annular duct with locally reacting liners. Contour maps of constant attenuation and phase speed were computed in the wall impedance plane for no-flow and several flow conditions, and experimental data were compared with some of these calculations. The effect of flow on modal attenuation and phase speed was measured and is theoretically verified. The major result of this study is the verification of theoretical predictions which ultimately can lead to a duct liner design optimization without resort to expensive and lengthy test programs. (Author)

**A73-44840 \* #** A difference theory for noise propagation in an acoustically lined duct with mean flow. K. J. Baumeister and E. J. Rice (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1007*. 10 p. 12 refs. Members, \$1.50; nonmembers, \$2.00.

A finite difference formulation is presented for sound propagation in a two-dimensional straight soft-walled duct with uniform flow. The difference analysis is developed in terms of complex notation. The governing acoustic difference equations and the appropriate displacement boundary conditions associated with uniform flow are presented. Example calculations are presented for the sound attenuation in straight hard and soft-walled ducts. At present the finite Mach number case is solved only for the one-dimensional hard walled duct. (Author)

**A73-44844 #** Theoretical studies of sound emission from aircraft ducts. H. D. Hogge and E. W. Ritzi (Douglas Aircraft Co., Long Beach, Calif.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1012*. 12 p. 11 refs. Members, \$1.50; nonmembers, \$2.00. Research sponsored by the Douglas Aircraft Independent Research and Development Program.

A finite-element solution to the problem of sound propagation in a duct of finite length and with axial variation in cross section and mean flow Mach number is obtained by matching cylindrical and conical duct elements. The effect of reflection from the open end is provided by a simple model of the radiation impedance of the opening. Examples are included to show the effects of (1) reflections from the open end, (2) source impedance, (3) mean flow, (4) cone angle, (5) cross section variation, and (6) finite wall impedance on the propagation of rotating pressure waves in ducts. (Author)

**A73-44848 #** The influence of aerodynamic flow noise in turbofan engines. R. A. Mangiarotti (Boeing Commercial Airplane Co., Seattle, Wash.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1016*. 5 p. 7 refs. Members, \$1.50; nonmembers, \$2.00.

The component noise sources of advanced technology turbofan engines are reviewed showing that previously unimportant noise sources are unmasked by the lowering of jet noise and the use of acoustic linings for reducing turbomachinery noise. The two main sources unmasked are the engine core noise and aerodynamic noise generated by airflow in the engine nacelle ducts. A review of aerodynamic noise mechanisms show that turbulent flow confined in a duct generates more energy than in free space, particularly at the lower frequencies. Because airflow is continuously generated along a duct whereas turbomachinery noise is attenuated by acoustic linings, aerodynamic noise could limit the attenuation of turbomachinery noise by linings. (Author)

**A73-44849 \* #** Noise comparisons from full-scale fan tests at NASA Lewis Research Center. M. F. Heidmann and C. E. Feiler (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1017*. 12 p. 11 refs. Members, \$1.50; nonmembers, \$2.00.

The overall aero and acoustic design features of eight 6-foot-diameter, single-stage fans tested in an outdoor acoustic facility are described. A correlation of the acoustic results for subsonic tip-speed fans showed the total sound power to be proportional to the mechanical power imparted to the fan and the specific work performed on the air to within plus or minus 2 dB. The correlation was relatively insensitive to fan design variables over a broad range of operating conditions. Maximum perceived noise levels were generally proportional to the sound power levels with both noise levels exhibiting a relatively unique increase with fan pressure ratio when normalized by the delivered thrust. The spectra of broadband noise attributed to the fan exhibited a bimodal characteristic for most of the fans. A predominant mode centered near the blade-passage tone and another at 8 to 16 times the tone frequency. (Author)

**A73-44850 #** Broadband noise generation by aerofoils and axial flow fans. B. D. Mugridge (Southampton, University, Southampton, England). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1018*. 10 p. 32 refs. Members, \$1.50; nonmembers, \$2.00. Research supported by the Ministry of Defence.

The generation of broadband noise by aerofoils and fan blades has been investigated and working formulae developed, for cases where the mean flow velocity is subsonic. The derivation of the aero-acoustic transfer function for unsteady flow interactions is the major feature of the paper. New two-dimensional wind tunnel data yield a flow-force relationship for acoustically compact aerofoils for reduced flow frequencies for both random and discrete interactions. Integrated force spectra compare favorably with standard unsteady lift theory although the surface pressure phase relationships do not conform to a Kutta edge criterion. The acoustic calculations utilise established line force models. (Author)

**A73-44851 #** Sound generation by wake cutting. H. Fujita and L. S. G. Kovaszny (Johns Hopkins University, Baltimore, Md.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1019*. 6 p. 7 refs. Members, \$1.50; nonmembers, \$2.00. Research supported by the United Aircraft Corp.

The sound generated by the interaction of an airfoil and a passing wake was studied experimentally. A square jet was 'cut' periodically by circular rods moving across the flow to produce a row of oblique wakes. A circular arc symmetrical airfoil was placed in the

flow, and by means of periodic sampling and averaging the strictly periodic components of the instantaneous surface pressure fluctuation at different chordwise locations on the airfoil as well as of the radiated sound field were determined. First, the airfoil leading edge was aligned with the wake to obtain a nearly two-dimensional interaction. Later, the airfoil was turned at an angle with respect to the wake so that the wake interaction swept spanwise along the leading edge (three-dimensional flow). All pressure fluctuations as well as the sound radiation were found to be decreasing with increasing skew angle between the airfoil and the wake. (Author)

**A73-44852 #** The effects of modulated blade spacing on static rotor acoustics and performance. P. A. Shahady, C. A. Lyon (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, Ohio), J. J. Schauer (Dayton, University, Dayton, Ohio), M. H. Chopin, and M. S. Ewing (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1020*. 7 p. Members, \$1.50; nonmembers, \$2.00.

A method to assess the aural detection possibilities of aircraft was developed in connection with programs designed to provide the technology to quiet military aircraft for reconnaissance/surveillance and special tactical operations. The aural detection of aircraft depends to a large extent on the background noise environment in which the receiver is located. Curves for a comparison of the aircraft acoustic noise signature and detection level criteria are shown in a graph. The effects of blade spacing on acoustic performance are theoretically analyzed. Theoretical findings are compared with the results of experimental studies. G.R.

**A73-44853 \* #** Multiple pure tone noise generation and control. M. J. Benzakein, S. B. Kazin, and C. T. Savell (General Electric Co., Evendale, Ohio). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1021*. 9 p. 8 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS3-12430.

The generation of multiple pure tones in supersonic flow is discussed. The theoretical results of Kurasaka are reviewed and compared with experimental data obtained on a 36-in. diameter, 1550 ft/sec, 1.6 pressure ratio fan. Detailed measurements on bow shock locations taken with pressure transducers indicate that blade to blade discrepancies are the source of MPT generation. The paper presents some experimental results on an attempt to reduce the shock strength, and subsequently the MPT's, through blade modifications. Other attempts at reducing the MPT's through wall treatment, high inlet flow Mach number, acoustically treated splitters - are discussed. Experimental data is presented on the validity of these noise reduction methods. (Author)

**A73-44854 #** Inlet geometry and axial Mach number effects on fan noise propagation. D. C. Mathews and R. T. Nagel (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1022*. 11 p. 8 refs. Members, \$1.50; nonmembers, \$2.00.

Extensions of existing noise propagation theories to three-dimensional inlets are developed and applied to the propagation behavior of both acoustic spinning modes and nonlinear shock waves in typical aircraft inlets operating under a range of conditions. Aspects of the propagation of linear spinning modes in contoured inlets are discussed together with questions of three-dimensional nonlinear shock wave theory. Results of experimental investigations are also considered, giving attention to a powered nacelle model engine, the effect of inlet contour changes at speeds near cutoff, and the study of a full scale high bypass ratio engine. G.R.

**A73-44855 #** A review of combustion generated noise. W. C. Strahle (Georgia Institute of Technology, Atlanta, Ga.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Con-*

*ference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1023*. 9 p. 38 refs. Members, \$1.50; nonmembers, \$2.00. NSF Grant No. GK-32544; Grant No. AF-AFOSR-72-2365.

The available information on noise generation by turbulent combustion processes is reviewed with the goal in mind to be able to predict its importance in core engine noise in turbopropulsion systems. Noise data from research burners, furnaces and engines are reviewed as are the available theories of combustion noise. Emphasis is placed upon the total sound power output and the spectral content as well as upon the effects of enclosures on the radiated noise. Conclusions are drawn concerning the research required to adequately assess the importance of combustion noise in turbopropulsion systems. (Author)

**A73-44857 #** Core engine noise. E. Grande (Foster-Miller Associates, Inc., Waltham, Mass.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1026*. 6 p. 13 refs. Members, \$1.50; nonmembers, \$2.00.

This paper considers sources of core noise in a turbofan engine. A brief assessment is made of noise due to obstructions in the flow passage, turbulence level and swirl in the mean flow, turbine noise due to interaction with upstream turbulence, and combustor noise. It is tentatively concluded that combustor noise is the primary source of core noise. A core noise prediction procedure is formulated, considering the noise generation in the combustion chamber and the noise transmission through the turbine and the primary exhaust nozzle. The resulting prediction scheme expresses the far field core noise level as a function of the turbine pressure ratio, the nozzle pressure ratio, the combustor inlet and outlet temperatures and the nozzle temperature, and the combustor configuration and size. Comparison of the measured and predicted core noise levels for two turbofan engines yields satisfactory agreement. (Author)

**A73-44858 #** Core engine noise. R. P. Gerend, H. A. Kumasaka, and J. P. Roundhill (Boeing Commercial Airplane Co., Seattle, Wash.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1027*. 10 p. 5 refs. Members, \$1.50; nonmembers, \$2.00.

The low frequency noise component of full-scale engines has generally exhibited a significant deviation from that observed for jet noise alone. Tests have indicated that at least a portion of this noise component is generated inside the engine, upstream of the exhaust nozzle. This 'excess' noise, called 'core noise,' has been studied. The studies include a model test, in which an artificial upstream noise source of known level was introduced. A full-scale engine test, involving a JT9D turbofan with an extended, lined tail pipe was also conducted. Other studies were concerned with the development of a preliminary prediction procedure, based on full-scale engine data. G.R.

**A73-44859 #** Mechanisms of externally blown flap noise. M. R. Fink (United Aircraft Research Laboratories, East Hartford, Conn.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1029*. 11 p. 20 refs. Members, \$1.50; nonmembers, \$2.00.

In the analysis of noise mechanisms, effects of reflection and shielding are considered together with the leading-edge noise, scrubbing noise, trailing-edge noise, and sideline and forward-flight effects. Under-the-wing spectra are discussed along with questions of under-the-wing directivity, over-the-wing spectra, and over-the-wing directivity. Noise beneath over-the-wing configuration models is typified by a sixth-power velocity law and a very small decrease of intensity as the exit direction is approached. G.R.

**A73-44860 \* #** Acoustic investigation of the engine-over-the-wing concept using a D-shaped nozzle. M. Reshotko and R. Friedman (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute*

of *Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1030*. 10 p. 11 refs. Members, \$1.50; nonmembers, \$2.00.

Small-model experiments were conducted of the engine-over-the-wing concept using a D-shaped nozzle in order to determine the static-lift and acoustic characteristics at two wing-flap positions. Configurations were tested with the flow attached and unattached to the upper surface of the flaps. Attachment was obtained with a nozzle flow deflector. In both cases, high frequency noise shielding by the wing was obtained. Configurations using the D-shaped nozzle are compared with corresponding ones using a circular nozzle. With flow attached to the flaps, the static lift and acoustic results are almost the same for both nozzles. Without the nozzle flow deflector (unattached flap flow), the D-nozzle is considerably noisier than a circular nozzle in the low and middle frequencies. (Author)

**A73-44861 # Progress in source noise suppression of subsonic tip speed fans.** F. B. Metzger (United Aircraft Corp., Hamilton Standard Div., Windsor Locks, Conn.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1032*. 13 p. 19 refs. Members, \$1.50; nonmembers, \$2.00.

Work has been proceeding to develop subsonic tip speed fan engines operating at low pressure ratio. The fans considered are inherently quieter than existing turbofans. However, on account of the great number of blades in these fans, there is still a significant amount of noise energy at the higher frequencies that contribute most to annoyance. Effects of new fan designs on the noise characteristics are discussed, giving attention to the incorporation of a few blades only, low tip speed, and low pressure ratios. G.R.

**A73-44862 # Spectral trends in rotor noise generation.** S. E. Wright (Southampton University, Southampton, England). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1033*. 12 p. 15 refs. Members, \$1.50; nonmembers, \$2.00. Research supported by the Science Research Council.

Rotor noise from a range of rotor types is examined, giving attention to propellers, helicopter rotors, and fans. The study assumes that the major radiation properties lie within the rotor, and are not affected to a first order by the presence of a duct. The effect of forward motion on the radiation process is assumed to be small for moderate forward speeds. Aspects of spectral adjustment are discussed together with questions regarding the minimum rotor noise, rotor excess noise, and rotor spectra. G.R.

**A73-44863 \* # A study to determine the feasibility of a low sonic boom supersonic transport.** E. J. Kane (Boeing Commercial Airplane Co., Seattle, Wash.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1035*. 11 p. 11 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS1-11877.

The objective of this study was to determine if a supersonic transport designed to produce a sonic boom signature with low overpressure represented a feasible concept. Two design goals were chosen: an overpressure of 1.0 psf or less for cruise at Mach 2.7 and an overpressure of 0.5 psf for cruise at Mach 1.5. Projected 1985 technology was assumed for the analysis. The principal effort was to develop cruise configurations capable of meeting the sonic boom goals. The Mach 2.7 goal was achieved with a blended arrow wing configuration and the Mach 1.5 design was a low arrow wing configuration with a horizontal tail. The development of these airplanes is summarized and the concept of a low sonic boom SST is evaluated. (Author)

**A73-44866 # A new device for measuring local acoustic power output of subsonic jets.** J. T. Yen (Grumman Aerospace Corp., Bethpage, N.Y.) and T. E. Siddon (British Columbia,

University, Vancouver, Canada). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1042*. 8 p. 6 refs. Members, \$1.50; nonmembers, \$2.00.

The use of microphone arrays or collector-microphone systems for the measurement of the total noise power output of a small volume element is discussed. The performance of a circular-arc array with 10 dynamic microphones is considered, taking into account measurements conducted in cases in which speakers operating at 500 and 1000 Hz were used as sources. With the aid of computer computations it is found that an optimal configuration is composed of a 14 feet diameter, semicircular array of 60 microphones. G.R.

**A73-44867 \* # Comparison of results obtained with various sensors used to measure fluctuating quantities in jets.** S. P. Parthasarathy, P. F. Massier, and R. F. Cuffel (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1043*. 8 p. 5 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS7-100.

An experimental investigation has been conducted to compare the results obtained with six different instruments that sense fluctuating quantities in free jets. These sensors are typical of those that have recently been used by various investigators who are engaged in experimental studies of jet noise. Intensity distributions and two-point correlations with space separation and time delay were obtained. The static pressure, density, and velocity fluctuations are well correlated over the entire cross section of the jet and the cross-correlations persist for several jet diameters along the flow direction. The eddies appear to be flattened in the flow direction by a ratio of 0.4. (Author)

**A73-44868 # Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet.** D. Y. Cheng (Santa Clara University, Santa Clara, Calif.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1044*. 6 p. Members, \$1.50; nonmembers, \$2.00.

**A73-44871 \* # Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel.** A. Atencio, Jr. (NASA, Ames Research Center, Moffett Field, Calif.) and P. T. Soderman (U.S. Army, Air Mobility Research and Development Laboratory, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Aero-Acoustics Conference, Seattle, Wash., Oct. 15-17, 1973, Paper 73-1047*. 9 p. 8 refs. Members, \$1.50; nonmembers, \$2.00.

A method to determine free-field aircraft noise spectra from wind-tunnel measurements has been developed. The crux of the method is the correction for reverberations. Calibrated loud speakers are used to simulate model sound sources in the wind tunnel. Corrections based on the difference between the direct and reverberant field levels are applied to wind-tunnel data for a wide range of aircraft noise sources. To establish the validity of the correction method, two research aircraft - one propeller-driven (YOV-10A) and one turbojet-powered (XV-5B) - were flown in free field and then tested in the wind tunnel. Corrected noise spectra from the two environments agree closely. (Author)

**A73-44887 Low-pressure prepreps as structural material for light-construction designs (Niederdruck-Prepreps als Konstruktionswerkstoff für die Leichtbauweise).** H. Schönland, A. Knop, and U. Neumann (Eltro GmbH und Co., Flensburg; Bakelite Gesellschaft mbH, Duisburg-Meiderich, West Germany). In: *Arbeitsgemeinschaft Verstärkte Kunststoffe, Open Meeting, 10th, Freudenstadt, West Germany, October 3-6, 1972, Reports*. Munich,

Carl Hanser Verlag; Hamburg, Verlag Brunke Garrels, 1972, p. 23-1 to 23-8. 7 refs. In German.

A number of novel low-pressure preimpregnated materials are discussed, giving attention to questions of material specifications. Problems of the selection of suitable binders and reinforcement materials are discussed together with details of the manufacture of prepreps and the advantages of the preimpregnation process in comparison to a procedure involving wet lamination. Methods concerning the processing of prepreps are considered along with the tools to be used, questions of the manufacture of structural components, and specific cases illustrating the use of the new manufacturing process. These cases include components for conventional aircraft, the 'Airbus,' and the Sikorsky helicopter. G.R.

**A73-44899 #** Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer (Izlučenje zvuka priamougol'noi plastinoy, kolebaniyehcheisia pod deistviem pul'satsii davleniya v turbulentnom pogranichnom sloe). R. A. Mkhitarov (Akademii Nauk SSSR, Akusticheskii Institut, Moscow, USSR). *Akusticheskii Zhurnal*, vol. 19, July-Aug. 1973, p. 580-587. In Russian.

**A73-44916 #** Distribution of losses in an annular cascade of an axial-flow compressor (Rozklad strat w kolowej palisadzie sprazarki osiowej). J. Kral (Instytut Lotnictwa, Warsaw, Poland). *Rozprawy Inzynierskie*, vol. 21, no. 2, 1973, p. 249-277. 28 refs. In Polish.

Published experimental data are analyzed in a study of factors affecting the distribution of total pressure losses in viscous flow of gas through annular cascades of axial-flow compressors. Three-dimensional aspects of the flow are examined along with their effects on boundary layer development and the formation of associated secondary flows resulting in vortices. Existing methods of calculating the magnitudes and radial distributions of pressure losses in axial-flow fans and compressors are reviewed. T.M.

**A73-44994 #** Program plan to develop airworthiness standards for STOL aircraft. R. A. Chubboy (FAA, Systems and Development Service, Washington, D.C.). *Canadian Aeronautics and Space Journal*, vol. 19, June 1973, p. 289-295.

This paper outlines a joint French/UK/US simulator program to develop criteria for supporting airworthiness standards for powered-lift transport category aircraft. STOL considerations, test methodology and some preliminary results obtained on the Baseline Breguet 941 are discussed. The following impressions are significant. Multiple configuration changes following balked landing and/or one engine inoperative go-around may not pose a problem for STOL aircraft. Thrust response in the landing approach seems to influence man/machine performance more than thrust margin, especially on go-around. Lateral/directional characteristics of the powered-lift aircraft are critical, especially during flare and immediately following touchdown in crosswind and/or turbulence. (Author)

**A73-44995 #** Some results from tests in the NAE high Reynolds number two-dimensional test facility on shockless and other airfoils. L. H. Ohman, J. J. Kacprzyński, and D. Brown (National Aeronautical Establishment, Ottawa, Canada). *Canadian Aeronautics and Space Journal*, vol. 19, June 1973, p. 297-312. 26 refs.

Results from investigations in the NAE high Reynolds number two-dimensional test facility on two classical NACA airfoils and two contemporary supercritical airfoils are presented. The results are compared with other published experimental data. Comparisons are also made with results from theoretical calculations performed at NAE for subcritical as well as supercritical flow, incorporating

boundary-layer displacement effects for some subcritical cases. Experimental and theoretical results compare favorably. Comparisons with other experimental data demonstrate good correspondence in some cases as well as gross discrepancies in other cases. For the latter, the discrepancies are attributed to Reynolds number effects or differences in experimental techniques. (Author)

**A73-45076 #** Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer (Dozhiganiye vysokotemperaturnykh produktov nepolnogo sgoraniya v sverkhzvukovom potoke pri vtorichnom vpryske oksiditelja). Z. G. Shaikhutdinov, A. M. Rusak, V. M. Klevanskii, I. S. Saburov, and L. F. Shaikhinurova. *Inzhenerno-Fizicheskii Zhurnal*, vol. 25, Aug. 1973, p. 197-203. In Russian.

**A73-45088 #** Processing experimental aviation data. R. L. Lackman (National Center for Atmospheric Research, Boulder, Colo.). *Atmospheric Technology*, Sept. 1973, p. 44-48. 5 refs.

The Research Aviation Facility (RAF) provides the atmospheric science community with an aircraft data gathering and data processing service. Several options of an existing computer program are available for processing aircraft data tapes. Aspects of standard data processing are discussed together with problems of special processing, data merging, data enhancement, and future software developments. It is pointed out that the acquisition of the Electra aircraft with its highly sophisticated instrumentation system has itself vastly expanded the RAF's data processing commitments. A new general processing program was developed in connection with new software developments. Aspects of future resource requirements are also considered. G.R.

**A73-45144** Toward reliable composites - An examination of design methodology. J. R. Eisenmann, B. E. Kaminski, D. L. Reed, and D. J. Wilkins (General Dynamics Corp., Convair Aerospace Div., Fort Worth, Tex.). *Journal of Composite Materials*, vol. 7, July 1973, p. 298-308. 9 refs.

The current deterministic design approach is reviewed, and an alternate reliability-based design procedure is described which is more appropriate to the distinct behavioral characteristics of composite materials. The proposed procedure treats: load generation, material characterization, reliability apportionment, scaling, and complexity. (Author)

**A73-45153 #** X-22A - The total in-flight simulator. J. L. Beilman (Calspan Corp., Buffalo, N.Y.). *Aircraft Engineering*, vol. 45, Sept. 1973, p. 8-12.

Recognition of the urgent need for a systematic approach to obtain reliable flying qualities data in advance of design has led to the concept of the variable stability aircraft. By 1970, the original concept of the variable stability aircraft had reached maturity in the Total In-Flight Simulator (TIFS). The TIFS has been used for simulation of the USAF B-1 Bomber, the Concorde SST, and the space shuttle vehicle. The basic characteristics of the new aircraft, called the X-22A, are discussed together with its variable stability system. G.R.

**A73-45154 #** Alternating current starter generators. D. O. Burns. *Aircraft Engineering*, vol. 45, Sept. 1973, p. 16-18, 21.

An alternator directly coupled to a spool of a jet propulsion engine produces a variable frequency of ac supply. This variable frequency can be converted to a constant (400 Hz) frequency by a switching device known as a cycloconverter. The use of the variable frequency generator as a variable frequency motor with the objective to start up the main engine electrically is considered. Cycloconverter starter-generators are compared with the more conventional methods, such as turbine starters. G.R.

**A73-45155 #** The use of single crystal blades. D. A. Petrov and A. T. Tumanov (Organisation für Internationale Lizenzen, Moscow, USSR). *Aircraft Engineering*, vol. 45, Sept. 1973, p. 20, 21.

Advantages of gas-turbine engines using single-crystal blades are connected with the absence of grain boundaries in the blade metal. In conventional castings grain boundaries are weak lines along which premature damage can occur. At very high temperatures single-crystal blades can operate for about four times as long as conventionally cast blades. The technique developed in the USSR for obtaining single-crystal blades is free from the limitations imposed on the choice of crystallographic orientation in an approach used in the U.S. G.R.

**A73-45156 #** Advantages of a fixed ground supply system. *Aircraft Engineering*, vol. 45, Sept. 1973, p. 30-32, 34.

In March 1972, a new aircraft ground supply system was introduced at London Heathrow, UK, which in its operation to date has clearly indicated the advantages of a fixed installation in this service. The installation supplies ground power to the aircraft using Pier Four, Terminal One. The ground supply system is discussed, giving attention to motor-alternators, plant control cubicles, selector switchboxes, the distribution cubicle, the busbar switchbox, the connector box, and fault protection devices. G.R.

**A73-45162** Burning rate studies of fuel air mixtures at high pressures. J. D. Knapton, I. C. Stobie (U.S. Army, Ballistics Research Laboratories, Aberdeen Proving Ground, Md.), and H. Krier (Illinois, University, Urbana, Ill.). *Combustion and Flame*, vol. 21, Oct. 1973, p. 211-220. 10 refs.

High pressure burning studies of fuel air mixtures (mainly JP4 and air) were carried out in a closed chamber to determine what parameters control the maximum combustion rate and maximum pressure. The fuel was injected through shower-type nozzles into air at initial pressures of 2000-4000 psi. Densities of loading ranged 0.18-0.38 gm/cu cm, and the equivalence ratio ranged 0.6-2.7 fuel to air. A method for evaluating the burning velocity is presented. It was found that a wide variation in the burning velocity could be obtained with maximum burning velocities occurring at minimum fuel air mixing times. The pressure-time history during the closed vessel explosion agrees remarkably well with a time cubed dependence. Such pressure-time data are used to interpret the pressure rise predicted by a simple isothermal model. (Author)

**A73-45172 #** Hypersonic flow about a spatial body with an attached shock wave (Giperzvukova obtikannya prostorovogo tila z pridenanoiu udarnolu khvilliu). L. I. Dzvoni (Kiivs'kil Derzhavnyi Universitet, Kiev, Ukrainian SSR). *Akademiia Nauk Ukrain's'koï RSR, Dopovidy, Seriya A - Fiziko-Tekhnichni i Matematichni Nauki*, vol. 35, Aug. 1973, p. 717-721. In Ukrainian.

Concepts of the hypersonic theory of small perturbations are applied to solve a Riemann-Poincaré boundary value problem formulated in an analysis of the characteristics of a flow about a slender rhombiform wing with an attached shock wave when the Mach number tends to infinity. Functions describing the shock wave curvature are obtained. V.Z.

**A73-45195 #** Increasing the critical rotational speed of the tail rotor drive shaft in SM-1 and SM-2 helicopters (Zwiekszenie liczby obrotów krytycznych wału napędu śmigła ogonowego śmigłowców SM-1 i SM-2). A. Jarczyk (Instytut Techniczny Wojsk Lotniczych, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 28, Sept. 1973, p. 6, 7, 41. In Polish.

Several structurally modified versions of the tubular segmented drive shaft used in the tail-rotor drive train of SM-1 and SM-2 helicopters were examined analytically and by full-scale vibration

tests in order to select the version providing the highest increase in critical rotational speed subject to tradeoffs involving ease of conversion during scheduled maintenance operations. Modifications evaluated entailed changes in shaft curvature and in the length, diameter, and number of individual shaft segments. The selected final version features an enlarged cross section of one shaft segment and provides a 600 rpm (21%) gain in the critical rotational speed. T.M.

**A73-45196 #** Principal failures of turbines during turbine engine operation (Zasadnicze niesprawności turbin w czasie eksploatacji silników turbinowych). M. Mokrzyńczak and M. Stukonis (Instytut Techniczny Wojsk Lotniczych, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 28, Sept. 1973, p. 8-15. 5 refs. In Polish.

Description of the main causes of in-service damage experienced by turbine blades in gas turbine engines. Engine operating conditions resulting in blade failure are defined, and the characteristic aspects and mechanisms of sustained damage are described for fatigue failure of blades at the airfoil section, fatigue fracture in fir-tree root attachments, damage produced by overheating in engines with axial-flow compressors, and damage resulting from overheating in unsteady engine operation. T.M.

**A73-45197 #** Reliability calculations for flight vehicles (Obliczenia niezawodności obiektów latających). J. Jazwinski, J. Migdalski, and W. Wieremiejczyk (Instytut Techniczny Wojsk Lotniczych, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 28, Sept. 1973, p. 16-18. In Polish.

Description of a method for estimating the reliability of repairable and nonrepairable flight vehicles (rockets, airplanes, helicopters, and parachutes). In the context of this article, reliability is understood as the measure of risk in using the particular vehicle at a given time under given physical conditions. The proposed graphical technique permits rapid estimates of (1) the probability that the vehicle will satisfy defined requirements through a given interval of time, (2) the cumulative risk function, and (3) the failure rate function. T.M.

**A73-45198 #** Modern structural materials in aviation (Współczesne materiały konstrukcyjne w lotnictwie). E. Gruszczyński (Instytut Techniczny Wojsk Lotniczych, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 28, Sept. 1973, p. 23-28. 15 refs. In Polish.

The properties and applications of various structural materials in modern aircraft are discussed together with research and development efforts aimed at new materials and improved technological processes. Relative merits, drawbacks, and typical uses are described for aluminum alloys, steels, titanium alloys, magnesium alloys, beryllium alloys, and laminate composites incorporating single-crystal fibers, polycrystalline fibers, glass fibers, and fibers of complex structure. T.M.

**A73-45199 #** Preparation of airport surfaces for heavy and supersonic aircraft (Przygotowanie nawierzchni lotnisk dla samolotów ciężkich i nadźwiękowych). R. Grzywacz (Instytut Techniczny Wojsk Lotniczych, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 28, Sept. 1973, p. 29-31. In Polish.

The need for special modifications of existing airport surfaces to accommodate heavy-load and supersonic aircraft is demonstrated by tabulating typical characteristics (static and dynamic load aspects, landing-gear configurations, and physical dimensions) of specific new cargo and SST airplanes. Attention is given to international regulations detailing length and width requirements as well as structural configurations of runway and taxi surfaces. T.M.

**A73-45245 # Propeller blade vibrations** (Organia lopat smigla). J. Maryniak, W. Mierzejewski, and J. Krutul (Warszawa, Politechnika, Warsaw, Poland). *Mechanika Teoretyczna i Stosowana*, vol. 11, no. 3, 1973, p. 229-243. 11 refs. In Polish.

Calculated modes and frequencies of natural vibrations for helicopter tail-rotor blades are compared with experimental results. Measured values of mass distribution, moments of inertia, and stiffness are used as the input data for calculations. The rotor blade is represented by eleven segments and is treated as a discrete system. Six mathematical models of the blade are analyzed with allowance for rotational inertia of individual blade segments. Eigenmodes and frequencies of flexural, torsional, and torsional-flexural vibrations calculated for the six models are compared with resonance measurements. T.M.

**A73-45264 \* A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors.** J. W. Leverton and J. S. Pollard (Westland Helicopters, Ltd., Yeovil, Somerset, England). *Journal of Sound and Vibration*, vol. 30, Sept. 22, 1973, p. 135-152. 14 refs. Research supported by the Ministry of Defence and NASA.

The broadband noise generated by full-scale and model rotors is compared in terms of spectral content and the dependence on tip speed and rotor thrust/pitch angle. Low frequency broadband noise and high frequency broadband noise are studied separately and blade 'scaling' effects are outlined. The degree of agreement between measurements and theoretical and semi-empirical prediction methods is reviewed together with the directionality patterns. The parameters relating to the overall noise are also discussed. It is shown that in general good agreement is obtained between the full-scale and model rotors when considering spectral content and the dependency of the noise levels on tip speed and thrust. The scaling factors usually considered applicable to the low frequency broadband noise do not, however, appear to apply to either the model or full scale rotors.

**A73-45269 Compressibility and sonic boom** (Compresibilidad y estampido sonico). M. C. Alvarez (IBERIA, Lineas Aereas de España, Madrid, Spain). *Revista de Aeronáutica y Astronáutica*, vol. 33, Aug. 1973, p. 601-615. 10 refs. In Spanish.

The compressibility characteristics of a fluid can be quantitatively represented with the aid of the Bulk modulus. Differences in sound propagation for incompressible and compressible fluids are considered, giving attention to formulas for the sonic velocity and the effects of various parameters on this velocity. Conditions for the five flight velocity ranges as determined by the Mach numbers are discussed, taking into account the formation of the Mach cone, details of air particle behavior, shock waves, and heating effects. An analysis is conducted of the various factors affecting the sonic boom. The application of general principles is demonstrated by an investigation of three specific hypothetical cases involving aircraft of different types. Sonic boom effects on water, land, and buildings are examined. G.R.

**A73-45309 Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core.** M. Lessen, N. V. Deshpande, and B. Hadji-Ohanes (Rochester, University, Rochester, N.Y.). *Journal of Fluid Mechanics*, vol. 60, Sept. 18, 1973, pt. 3, p. 459-466. 8 refs. NSF-supported research.

The stability of a potential vortex in the presence of a rotating and a nonrotating axial jet core is examined theoretically. The eigenvalue problem has been solved numerically, and the influence of the ratio of the strength of the vortex to the axial velocity of the jet is determined. Numerical values of the growth rates are obtained, and it is shown that the potential vortex becomes unstable in the presence of a rotating axial jet. T.M.

**A73-45345 'Air piracy' and the latest work of ICAO on this subject** (La 'piraterie aérienne' et les derniers travaux de l'OACI à ce sujet). G. Guillaume. *Revue Française de Droit Aérien*, vol. 27, July-Sept. 1973, p. 257-260. In French.

J. L. Kneifel. *Revue Française de Droit Aérien*, vol. 27, July-Sept. 1973, p. 261-283. 16 refs. In French.

**A73-45358 # Effect of a slipstream on the acoustic radiation of ultrasonic annular jets** (Vplyv suputnogo potoku na akustichne viprominiuvannya nadzvukovimi kil'tsevimy strumeniami). V. O. Liutii and O. I. Shvets' (Kiivskii Derzhavnyi Universitet, Kiev, Ukrainian SSR). *Akademiia Nauk Ukrain's'koi RSR, Dopovidi, Seriya A - Fiziko-Tekhnichni i Matematichni Nauki*, vol. 35, July 1973, p. 639-642. In Ukrainian.

A setup with changeable nozzles is used in the measurement of slipstream effects on the acoustic radiation of annular jets at M 2.0, 3.1 and 3.6. The depressing effect of a slipstream on the acoustic wave expansion in ultrasonic annular jets is discussed. Decay of acoustic radiation with the increasing slipstream is noted. V.Z.

**A73-45373 Noise - Maplin and the new technology.** P. G. Masfield. *Flight International*, vol. 104, Aug. 16, 1973, p. 301-309.

The history and controversy surrounding the proposed third London airport at Maplin are reviewed. Maplin is seen as a planned development to reduce noise and to add runway capacity. The questions of whether the assumptions are correct about Maplin's potential benefit in relief of noise, whether there is a real requirement for more runway capacity, and Maplin's alleged environmental advantages are evaluated. In general, it is considered that the choice of Maplin would not be satisfactory. F.R.L.

**A73-45374 Hush-kits or new fans.** M. J. T. Smith (Rolls-Royce, Ltd., Engine Div., Derby, England). *Flight International*, vol. 104, Aug. 16, 1973, p. 318, 319.

There are two alternative approaches to noise reduction. That offering the lowest initial cost is the concept of a single 'add-on' suppressor kit. The second approach involves a partial or complete re-engining of the aircraft. Refanning is an attempt to produce the noise signature of the new high-bypass engines without the expense of a complete engine redesign. It has been found possible to provide engine cycles at about half the bypass ratio of the RB.211 with a varying take-off thrust in the region of 14,000 to 16,000 lb according to the fan and turbine design. F.R.L.

**A73-45377 # The combustion process in a pulsejet engine** (Proces spalania w silniku pulsacyjnym). S. Wojcicki (Warszawa, Politechnika, Warsaw, Poland). *Archiwum Procesow Spalania*, vol. 3, no. 1, 1972, p. 51-57. In Polish.

The combustion process in a pulsejet engine is described on the basis of experimental data obtained by direct and schlieren photography and by measurement of pressure distributions in the combustion chamber. It is shown that self-ignition in the combustion chamber is a consequence of the turbulent mixing of the inlet air and

fuel doses with combustion products remaining from the preceding cycle. Ignition by compression waves is not a necessary condition for continuous operation of the engine, and combustion gases containing burning particles from the previous cycle can provide ignition. Continuous operation is conditioned by the requirement for feedback between pressure changes and the combustion rate. T.M.

**A73-45381 #** Some comments to mathematical interpretation of performance characteristics of jet engine combustion chambers. O. Schurek (Vyzkumny a Zkusebni Letecký Ústav, Prague, Czechoslovakia). *Archiwum Procesow Spalania*, vol. 3, no. 2, 1972, p. 133-151.

A survey is presented of the problems in analyzing combustion chambers of jet engines. The solution of the work is divided into partial blocks: analysis of throttling and altitude characteristics, the selection of the form and the type of chamber, and choice of the air-inlet law. The analysis proceeds by designing an atomization device, and then analyzing chamber pressure losses, the combustion efficiency, the ignition and extinguishing characteristics and the temperature profile. For the solution of individual analytical blocks, results of experimental works, some statistical techniques, and a digital computer have been employed. (Author)

**A73-45391** The POHWARD takeoff assist system (Start-hilfegerät POHWARD). P. Küng. *Flug Revue/Flugwelt International*, Oct. 1973, p. 23-26. In German.

The POHWARD (Pulsated Over-Heated Water ROcket) system, developed in Switzerland, is described. By providing additional thrust, primarily, for military combat aircraft, the system provides higher loading levels, and permits takeoff from shorter runways and under critical temperature and weather conditions. An attractive feature of the system is its low cost of operation. V.P.

**A73-45399** A review of the American RPV scene. I. Stambler. *Interavia*, vol. 28, Oct. 1973, p. 1070-1073.

The remotely piloted vehicle (RPV) can, in the opinion of its adherents, offer many of the capabilities of manned aircraft for a fraction of the cost. Applications being considered include several reconnaissance roles, electronic warfare systems, target acquisition, weapon delivery, air-to-air combat, and various combinations of these. Vehicles in hardware form include both expendable and nonexpendable systems. A number of current RPV projects undertaken by various manufacturers are reviewed. It is emphasized that electronics are vital to the success of the overall RPV concept. F.R.L.

**A73-45443** Liability and insurance in international air traffic (Haftung und Versicherung im internationalen Luftverkehr). I. H. P. Diederiks-Verschoor, W. P. Heere, and A. Moll. *Zeitschrift für Luftrecht und Weltraumrechtsfragen*, vol. 22, Oct. 1, 1973, p. 250-257. 15 refs. In German. (Translation). Research supported by the Rijksuniversiteit te Utrecht.

International air-traffic liability agreements (which also have been declared applicable to national air-traffic by most of the signatory states) are examined in some detail. The problem of passenger accident insurance and aircraft (not cargo) insurance in international air-traffic is discussed. V.P.

**A73-45444** Flight safety, air traffic control, and liability (Flugsicherheit, Luftverkehrskontrolle und Haftung). E. Ruhwedel. *Zeitschrift für Luftrecht und Weltraumrechtsfragen*, vol. 22, Oct. 1,

1973, p. 258-271. 43 refs. In German.

The changes in aviation laws, resulting from the continuous growth and new developments in air traffic are reviewed. Particular attention is given to liability situations where accidents are caused by flight controller errors or by malfunction of AFC equipment. It is shown that the liability regulations in the field of air traffic control have become obsolete and require a thorough revision. V.P.

**A73-45475** RAT has hydraulic pitch change servo. P. W. Morris (Dowty Rotol, Ltd., Cheltenham, Glos., England). *Hydraulics and Pneumatics*, vol. 26, Oct. 1973, p. 87-90.

An emergency power source for retaining control of an aircraft in the event of complete main engine failure must become available immediately when needed. The emergency power source must also have an extremely high standard of integrity. The ram air turbine (RAT) meets both requirements. The constant speed features of the turbine are discussed together with aspects of turbine installation, the hydraulic pitch control system, and the governor valve. Questions of RAT operation are considered along with details of hydraulic pump control, in-service testing, and checkout. G.R.

**A73-45529 #** Universal equations for the laminar boundary layer on a body of revolution in oblique flow (Universal'nye uravneniia laminarnogo pograničnogo sloia na tele vrashcheniia v kosom gazovom potoke). L. I. Bogovaia. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, July-Aug. 1973, p. 32-41. 6 refs. In Russian.

The laminar motion of a gas at an angle of incidence in the boundary layer on a body of revolution is examined. A solution is obtained by Loitsianskii's (1965) parametric method, in which the influence of the external flow and of the configuration of the body is taken into account by introducing three series of parameters. The corresponding system of universal equations is integrated numerically over a wide range of parameters and their combinations. V.P.

**A73-45540 #** Approximate calculation of the cavitation flow past low-aspect-ratio wings (Priblizhennyi raschet kavitatsionnogo obtekaniiia kryl'ev malogo udlineniia). I. I. Efremov and R. A. Soroka. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, July-Aug. 1973, p. 166-170. In Russian.

The system of singular integral equations of a cavitating low-aspect-ratio wing is reduced to one dimensional equations with the aid of the Lawrence (1951) approximation. The equations are solved numerically by the method of discrete singularities. Plots of cavitation number vs the cavity length for various aspect ratios and plots of the lift coefficient vs the aspect ratio for various cavitation numbers are presented. V.P.

**A73-45542 #** Determination of the impulses and moments imparted by shock waves to bodies of revolution (Ob opredelenii impul'sov sil i momentov, soobshchaemykh telam vrashcheniia udarnymi volnami). V. A. Kazakov. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Ju'y-Aug. 1973, p. 186-190. In Russian.

The three-dimensional problem of the unsteady supersonic flow past a body of revolution along which glides a weak incident shock wave is discussed for the case of constant flow parameters behind the shock front and for the case where the pressure gradient vanishes according to a linear law. The total impulses and moments imparted to the body during the transient process are computed. V.P.

**A73-45547** Nonuniform supersonic flow past wedges. S. Nadir (Northrop Corp., Aircraft Div., Hawthorne, Calif.). *Zeitschrift für angewandte Mathematik und Physik*, vol. 24, May 25, 1973, p. 355-364.

Consideration of the problem of the flowfield over pointed

**A73-45547**

wedges in an isoenergetic flow of thermally and calorically perfect gases in which the nonuniform incident flow is such that it results in attached shock waves. It is shown that the one-strip approximation of the method of integral equations is capable of predicting physically realistic surface pressure distributions. A comparison is made between theoretical predictions and experimental data in examples involving the determination of ramp surface pressures in two-dimensional inlets.

A.B.K.

inlet locations ahead of and under the wing to assess the effects of forebody geometry for the conditions indicated. The data indicate the influence of the canopy, nose droop, and fuselage shape on flow angularities in the forward survey plane. Author

**RESEARCH ON THE SONIC BOOM PROBLEM. PART 1: SECOND-ORDER SOLUTIONS FOR THE FLOW FIELD AROUND SLENDER BODIES IN SUPERSONIC FLOW FOR SONIC BOOM ANALYSIS** Final Report

M. Landahl and P. Loeftgren Washington NASA Oct. 1973 66 p refs

(Grant NGR-52-120-001)

(NASA-CR-2339; FFA-AU-621-Pt-1) Avail: NTIS HC \$3.50 CSCL 20D

A second-order theory for supersonic flow past slender bodies is presented. Through the introduction of characteristic coordinates as independent variables and the expansion procedure proposed by Lin and Oswatitsch, a uniformly valid solution is obtained for the whole flow field in the axisymmetric case and for far field in the general three-dimensional case. For distances far from the body the theory is an extension of Whitham's first-order solution and for the domain close to the body it is a modification of Van Dyke's second-order solution in the axisymmetric case. From the theory useful formulas relating flow deflections to the Whitham F-function are derived, which permits one to determine the sonic boom strength from wind tunnel measurements fairly close to the body. A large scale, variable-geometry inlet system with a design Mach number of 3.0 was tested at Mach numbers from 0.6 to 1.28. Variable features for off-design operation are an adjustable-height ramp system and a translating cowl. Experimental results are presented for transonic ramp and cowl positions showing the effect of throat boundary layer bleed and vortex generators on engine-face performance. Detailed pressure and force-balance data are used to evaluate transonic drag characteristics. Author

An analytical and experimental investigation into the effects of blade tip clearance on inducer performance and of leading edge sweepback on both blade pressure loading and performance was performed. Tip clearance flow was represented with a vortex flow model and measured data from previous inducer tests at three clearances were correlated with model predictions. A leading edge model was added to an existing inducer internal flow analysis, tests with two sweepbacks were conducted, and blade pressure and performance predictions were correlated with measured data. H. L. Wesoky and F. W. Steffen 1973 32 p refs Presented at the 9th Propulsion Joint Specialist Conf., Las Vegas, Nev., 5-7 Nov. 1973; cosponsored by AIAA and SAE

(NASA-TM-X-71445; E-7705) Avail: NTIS HC \$3.75 CSCL 20D

Aerodynamic and acoustic measurements at a typical STOL aircraft takeoff and landing velocity demonstrated that a 1.35 inlet lip area contraction ratio was superior to a 1.26 ratio at high nacelle incidence angles. Reverse thrust, obtained with a variable pitch rotor, was lower at the landing velocity, and the noise level higher, than at the static condition. High speed tests showed that, for the design cruise Mach number of 0.75, internal losses and external drag were 27 percent of the ideal fan net thrust, and propulsive efficiency was estimated to be 59 percent for an 85 percent efficient fan stage. Analytically computed flow parameters were compared to measured values for the midspan double-circular-arc section of a stator in subsonic flow. Analytical procedures included calculations for inviscid flow, blade surface boundary layers, and loss coefficients. Comparisons were made at three incidence angles. Methods for prescribing the exit fluid angle in inviscid flow calculations were investigated. Measured loss coefficients were compared to calculated values. Two methods for predicting performance involving iterative use of ideal flow and boundary layer calculations were investigated. Author

A 10-deg circular cone with various spherical and conical (45 degrees) nose bluntnesses of 1.7%, 10% and 25% was investigated in ARL's Mach-14 wind tunnel. Test results confirm that the static and dynamic stability coefficients are not equal in pitch and in yaw for nonzero angles of attack if the pitching moment becomes a nonlinear function of angle of attack due to nose blunting. The inequality of the in plane and out of plane stability derivatives was found at small angles of attack which are only fractions of the cone half angle. Author (GRA)

**OPTIMAL MULTIPLE AIRCRAFT CONTROL FOR TERMINAL AREA APPROACH** Ph.D. Thesis  
David Kelso Schmidt 1972 176 p  
Avail: Univ. Microfilms Order No. 73-15862

The specification of the curved approach paths and landing sequence for a group of aircraft desiring to land in a terminal area such that the terminal-area system performance is maximized was investigated. The multiple-aircraft problem includes the aspect of competition or cooperation between the vehicles by formulating the problem as a set of disconnected optimal trajectories. The flight paths are governed by kinematic equations of motion while in-flight and terminal-time separation inequality constraints between trajectories are imposed. The performance criterion for the system is the sum of the flight durations plus the integrated weighted accelerations of the aircraft. The solution approach employs penalty functions for the treatment of the inequality constraints and is based on the steepest descent algorithm. Dissert. Abstr.

Avail: Univ. Microfilms Order No. 73-16332

The cause and effect relationships which exist among the parameters associated with a parachute-payload system during the deployment and trajectory are analyzed. A computer simulation model with the capability of providing a wide range of flexibility in predicting the characteristics of full-scale and model systems in flight was developed. Prior to the study, most research was concentrated on the analysis of individual areas of parachute technology such as parachute inflation, snatch force, parachute filling time and steady state trajectories. The simulation integrates the specific characteristics of the parachute-payload system, airdrop aircraft and drop zone into a conglomerate analysis which can be exercised as many times as needed to evaluate the various parameters. Various methods for far-field noise reduction of a tilt-rotor acoustic signature and the performance and weight tradeoffs which result from modification of the noise sources are considered in this report. In order to provide a realistic approach for the investigation, the Boeing tilt-rotor flight research aircraft (Model 222), was selected as the baseline. This aircraft has undergone considerable engineering development. Its rotor has been manufactured and tested in the Ames full-scale wind tunnel. The study reflects the current state-of-the-art of aircraft design for far-field acoustic signature reduction and is not based solely

on an engineering feasibility aircraft. This report supplements a previous study investigating reduction of noise signature through the management of the terminal flight trajectory. Author

(NASA-TM-X-62244) Avail: NTIS HC \$6.75 CSCL 01C

The low-speed characteristics of a large-scale model of the U. S. Navy/Grumman F-14A aircraft were studied in tests conducted in the Ames Research Center 40- by 80-Foot Wind Tunnel. The primary purpose of the program was the determination of lift and stability levels and landing approach attitude of the aircraft in its high-lift configuration. Tests were conducted at wing angles of attack between minus 2 deg and 30 deg with zero yaw. Data were taken at Reynolds numbers ranging from 3.48 million to 9.84 million based on a wing mean aerodynamic chord of 7.36 ft. The model configuration was changed as required to show the effects of glove slat, wing slat leading-edge radius, cold flow ducting, flap deflection, direct lift control (spoilers), horizontal tail, speed brake, landing gear and missiles. (FAA-RD-73-4) Avail: NTIS HC \$12.50 CSCL 20A

A multiphase theoretical investigation on predicting and alleviating sonic boom intensity is described. A new theory to predict sonic boom intensity on the ground from wind tunnel tests using normal size models (as opposed to the very small models presently used) was developed. A relatively easy method to determine aircraft contours with desirable finite pressure rise times is presented, as is a method to determine phantom body shapes with desirable pressure rise times which can be simulated by heat addition to the flow upstream of the aircraft. It is shown that a slotted nozzle engine exhaust has the unique capability to shift lift from the solid surface of the wing to the region behind the wing, with a resulting reduction in sonic boom intensity. **A FIXED-BASE SIMULATION STUDY OF TWO STOL AIRCRAFT FLYING CURVED, DESCENDING INSTRUMENT APPROACH PATHS**

Margaret S. Benner, Richard H. Sawyer, and Milton D. McLaughlin Washington Oct. 1973 35 p

(NASA-TN-D-7298; L-8868) Avail: NTIS HC \$3.00 CSCL 01C

A real-time, fixed-base simulation study has been conducted to determine the curved, descending approach paths (within passenger-comfort limits) that would be acceptable to pilots, the flight-director-system logic requirements for curved-flight-path guidance, and the paths which can be flown within proposed microwave landing system (MLS) coverage angles. Two STOL aircraft configurations were used in the study. Generally, no differences in the results between the two STOL configurations were found. The investigation showed that paths with a 1828.8 meter turn radius and a 1828.8 meter final-approach distance were acceptable without winds and with winds up to at least 15 knots for airspeeds from 75 to 100 knots. The altitude at roll-out from the final turn determined which final-approach distances were acceptable. Pilots preferred to have an initial straight leg of about 1 n. mi. after MLS guidance acquisition before turn intercept. The size of the azimuth coverage angle necessary to meet passenger and pilot criteria depends on the size of the turn angle: plus or minus 60 deg was adequate to cover all paths except ones with a 180 deg turn. **FLIGHT INVESTIGATION OF A STRUCTURAL MODE**

**CONTROL SYSTEM FOR THE XB-70 AIRCRAFT**

Wilton P. Lock, Eldon E. Kordes, James M. McKay, and John H. Wykes (N. Am. Rockwell Corp., Los Angeles) Washington Oct. 1973 83 p refs  
(NASA-TN-D-7420; H-732) Avail: NTIS HC \$3.75 CSCL 01C

A flight investigation of a structural mode control system termed identical location of accelerometer and force (ILAF) was conducted on the XB-70-1 airplane. During the first flight tests, the ILAF system encountered localized structural vibration problems requiring a revision of the compensating network. After modification, successful structural mode control that did not adversely affect the rigid body dynamics was demonstrated. The ILAF system was generally more effective in supersonic than subsonic flight, because the conditions for which the system was designed were more nearly satisfied at supersonic speeds. The results of a turbulence encounter at a Mach number of 1.20 and an altitude of 9754 meters indicated that the ILAF system was effective in reducing the vehicle's response at this flight condition. An analytical study showed that the addition of a small canard to the modal suppression system would greatly improve the automatic control of the higher frequency symmetric modes.

**SIMULATOR EVALUATION OF THE LOW-SPEED FLYING QUALITIES OF AN EXPERIMENTAL STOL CONFIGURATION WITH AN EXTERNALLY BLOWN FLAP WING OR AN AUGMENTOR WING**

Bruce G. Powers and David A. Kier Washington Oct. 1973 74 p refs  
(NASA-TN-D-7454; H-780) Avail: NTIS HC \$3.50 CSCL 01C

The low-speed flying qualities of an experimental STOL configuration were evaluated by using a fixed-base six-degree-of-freedom simulation. The configuration had either an externally blown flap (EBF) wing or an augmentor wing (AW). The AW configuration was investigated with two tails, one sized for the AW configuration and a larger one sized for the EBF configuration. The emphasis of the study was on the 70-knot approach task. The stability and control characteristics were compared with existing criteria. Several control systems were investigated for the normal four-engine condition and for the engine-out transient condition. Minimum control and stall speeds were determined for both the three- and four-engine operation.

**ESCAPE MEASURES FOR COMBAT HELICOPTER CREWS**

Aug. 1973 39 p refs  
(AGARD-AR-62) Avail: NTIS HC \$4.00

A study was conducted to determine the requirements and

characteristics of escape systems for use with helicopters. It was stated that escape systems are feasible, but that the rotary wing creates the greatest obstacle to emergency seat ejection. It was recommended that helicopter escape concepts be considered under the following categories: (1) an escape system for retrofit into helicopters already in production or in service, (2) an escape system for a near-term solution, and (3) an escape system for a far-term solution. The conclusion of the study was that a retrofitable escape system is practical only if it requires an absolute minimum of development time and does require major changes to the helicopter. The only likely candidates to satisfy the requirement are manual bailout or sideward ejection.

**FLIGHT CALIBRATION TESTS OF A NOSE-BOOM-MOUNTED FIXED HEMISPHERICAL FLOW-DIRECTION SENSOR**

Katharine H. Armistead and Lannie D. Webb Washington Oct. 1973 29 p refs  
(NASA-TN-D-7461; H-779) Avail: NTIS HC \$3.00 CSCL 01C

Flight calibrations of a fixed hemispherical flow angle-of-attack and angle-of-sideslip sensor were made from Mach numbers of 0.5 to 1.8. Maneuvers were performed by an F-104 airplane at selected altitudes to compare the measurement of flow angle of attack from the fixed hemispherical sensor with that from a standard angle-of-attack vane. The hemispherical flow-direction sensor measured differential pressure at two angle-of-attack ports and two angle-of-sideslip ports in diametrically opposed positions. Stagnation pressure was measured at a center port. The results of these tests showed that the calibration curves for the hemispherical flow-direction sensor were linear for angles of attack up to 13 deg. The overall uncertainty in determining angle of attack from these curves was plus or minus 0.35 deg or less. A Mach number position error calibration curve was also obtained for the hemispherical flow-direction sensor. The hemispherical flow-direction sensor exhibited a much larger position error than a standard uncompensated pitot-static probe.

**APPLICATION OF COMPOSITES TO HELICOPTER AIRFRAME AND LANDING GEAR STRUCTURES** Technical Report, Jul. 1972 - Feb. 1973

M. J. Rich, G. F. Ridgley, and D. W. Lowry Sep. 1973 138 p refs Sponsored in part by Army  
(Contract NAS1-11688)  
(NASA-CR-112333) Avail: NTIS HC \$9.00 CSCL 01C

A design study has indicated that advanced composite helicopter airframe structures can provide significant system cost advantages. The most successful concept was found to be all-molded composite modular panels which provide integral skin/stringer and frame subassemblies. Based on present information it is estimated that a prototype composite airframe would cost approximately four percent more than a prototype metal frame. The difference is due primarily to the higher engineering design time, as the increased materials cost is largely offset by reduction of fabrication labor costs.

**SUMMARY OF STABILITY AND CONTROL CHARACTERISTICS OF THE XB-70 AIRPLANE**

Chester H. Wolowicz and Roxanah B. Yancey Washington Oct. 1973 56 p refs  
(NASA-TM-X-2933; H-781) Avail: NTIS HC \$3.50 CSCL 01C

The stability and control characteristics of the XB-70 airplane were evaluated for Mach numbers up to 3.0 and altitudes up to 21,300 meters (70,000 feet). The airplane's inherent longitudi-

dinal characteristics proved to be generally satisfactory. In the lateral-directional modes, the airplane was characterized by light wheel forces, low static directional stability beyond approximately 2 deg of sideslip, adverse yaw response to aileron inputs throughout the entire Mach number range, and negative effective dihedral with wingtips full down. At subsonic Mach numbers, with the flight augmentation control system off, the light wheel forces and adverse yaw response to aileron inputs caused the pilots to minimize use of the ailerons. At supersonic Mach numbers, with the augmentation system off, the adverse yaw due to aileron and the negative effective dihedral were conducive to pilot-induced oscillations. Author

**COMPARISON OF GROUND AND FLIGHT TEST RESULTS USING A MODIFIED F106B AIRCRAFT**

Fred A. Wilcox 1973 20 p refs Presented at 9th Propulsion Joint Specialist Conf., Las Vegas, Nev., 5-7 Nov. 1973; sponsored by AIAA and SAE (NASA-TM-X-71439; E-7695) Avail: NTIS HC \$3.00 CSCL 01C

Two aft underwing nacelles housing afterburning J85 engines were added to an F106 to study exhaust nozzles in flight at Mach numbers up to 1.3. Installation effects were determined for several nozzles by comparing flight data to data from an isolated wind tunnel model. Reynolds number effects were studied at subsonic flight speeds for nozzles intended for use with afterburning turbofan engines. A wide range of Reynolds number was obtained by flying the F106 over a range of altitude and by using 5 and 22% wind tunnel models of the F106. A contoured nozzle had a boattail drag as low as that of a longer circular arc nozzle over the Reynolds number range studied. Author

**LONGITUDINAL MOTION OF AN AIR LINER DURING STEEP APPROACH [ZUR LAENGSBEWEGUNG EINES VERKEHRSFLUGZEUGS BEI STEILEN ANFLUEGEN]**

G. Bruening, J. Lademann, and D. Schafranek 1973 24 p ref In GERMAN Presented at the DGLR-DGON Symp. on Neue Anflug- und Landeverfahren, Duesseldorf, 2-4 May 1973 (DGLR-Paper-73-023) Avail: NTIS HC \$3.25

Calculations were carried out on a Boeing 707 aircraft in order to assess the effects on longitudinal stability of steep approach landings. The investigations point out that the present passenger aircraft can perform steeper than usual landings. The sinking velocity will increase as the path velocity remains unchanged. In order to avoid too much throttling of the engines, the air brakes should be lowered. The dynamic longitudinal stability is only slightly disturbed. The angle of attack oscillation will be slightly undampened, the phugoid dampened. A glide path of 3 deg is recommended. ESRO

**NOISE REDUCING METHODS FOR STOL AIRCRAFT APPROACH AND TAKE-OFF [LAERMREDUZIERENDE AN- UND ABFLUGVERFAHREN FUER STOL-FLUGZEUGE]**

K. Weise and H. Anders 3 May 1973 43 p refs In GERMAN Presented at the DGLR-DGON Symp. on Neue Anflug- und Landeverfahren, Duesseldorf, 2-4 May 1973

(MBB-UH-06-73-O; DGLR-Paper-73-039) Avail: NTIS HC \$4.25

The noise propagation of three projected STOL aircraft was investigated during takeoff and approach flight. It was shown that takeoff noise can be reduced a few dB by thrust reduction (three segment takeoff profile) near airports. As with CTOL aircraft, the landing paths should be as steep as possible, and landing flaps and gear should be lowered at low altitude. By using all possibilities during landing, obtainable noise reduction can be considerable. Keeping to the exact flight path was also found to be noise reducing. ESRO

H. Boehret 1973 32 p refs In GERMAN Presented at the DGLR-DGON Symp. on Neue Anflug- und Landeverfahren, Duesseldorf, 2-4 May 1973

(DGLR-Paper-73-030) Avail: NTIS HC \$3.75

An integrated flight control system, FRG 70, which is especially adapted to curved flight path profiles, is presented. The feedback control parameters are coupled to elevators and thrust, which limitation facilitates the realization of this principle. The system is characterized by a precise matching to the aerodynamic flow conditions and high passenger comfort. The exact path guidance is supported by a path angle dependent thrust control, allowing for larger thrust rest. The properties of the integrated system were analyzed during over 500 automatic approaches and landings. They can be improved by direct lift controls and by using a monitor display. ESRO

**DEVELOPMENT AND EVALUATION OF AN AUTOMATIC DEPARTURE PREVENTION SYSTEM AND STALL INHIBITOR FOR FIGHTER AIRCRAFT Final Report**

Robert T. N. Chen, Fred D. Newell, and Arno E. Schelhorn Wright-Patterson AFB, Ohio AFFDL Apr. 1973 126 p refs (Contract F33615-72-C-1162; AF Proj. 8225; AF Proj. 8219) (AD-764767; CALSPAN-AK-5112-F-1; AFFDL-TR-73-29) Avail: NTIS CSCL 01/3

The report documents the conceptual design, breadboard development and pilot-in-the-loop evaluation of an automatic departure prevention system and a stall inhibitor for fighter aircraft. Using the A-7D as the study aircraft, a departure boundary characterized by alpha and beta was determined from the available data. This departure boundary was then used to help design an

automatic departure preventer and a stall inhibitor. An automatic departure prevention device as described in the report works smoothly and will benefit the A-7 aircraft. With just the departure preventer, the pilots could maneuver freely, with great confidence and use the full capability of the airplane, well beyond the present departure boundary. **PREDICTING HEADING TASK FLYING QUALITIES WITH PAPER PILOT** M.S. Thesis

Calvin Ronald Taylor Jun. 1973 136 p refs  
 (AD-764695; GE/MA/73-1) Avail: NTIS CSCL 01/3

A mathematical model for predicting the pilot rating of a fighter aircraft in a precision heading task is described. The model includes the lateral-directional aircraft equations of motion, a stochastic gust model, a pilot model with four free pilot parameters, and a pilot rating expression that is a function of rms heading angle, rms yaw rate, and rms roll rate. The pilot gains and lead time constants are selected to minimize the pilot rating expression. The resulting minimum is used to compute a heading paper pilot rating. The heading paper pilot rating was computed for 32 flight conditions at different gust intensities for the F-5 and A-7 aircraft. Heading paper pilot ratings agree well with the actual ratings for the F-5, but are low for the A-7. In addition, there is good correlation between computed and actual rms heading angle, rms yaw rate, and rms slideslip.

**AN IMPROVED METHOD OF PREDICTING AIRCRAFT LONGITUDINAL HANDLING QUALITIES BASED ON THE MINIMUM PILOT RATING CONCEPT** M.S. Thesis

John D. Arnold Jun. 1973 152 p refs  
 (AD-764696; GGC/MA/73-1) Avail: NTIS CSCL 01/3

A fixed-base simulation of some of the flight tests in the USAF/CAL variable stability T-33 aircraft was performed. The task was maintaining pitch attitude in the presence of vertical turbulence. The root-mean-square state data and parameters in a linear pilot model were determined from the simulation. These items were correlated with the Cooper-Harper Pilot Ratings. This led to the development of a pilot-rating expression based on rms state errors and pilot workload. This rating expression was used in a digital computer program to accurately predict pilot ratings and rms state errors using only the aircraft stability derivatives, airspeed, and altitude as inputs.

**DESIGN AND INVESTIGATION OF A WIND-SHEAR-PROOF CONTROL SYSTEM FOR AUTOMATIC LANDING** M.S. Thesis

Louise G. Trivett Jun. 1973 81 p refs  
 (AD-764697; GGC/MA/73-4) Avail: NTIS CSCL 01/2

An analog computer simulation of the longitudinal portion of an All-Weather Landing System is presented. The linearized longitudinal equations of motion of a DC-8 aircraft during landing approach are converted to state-variable form to facilitate the analog simulation. An Advanced Automatic Flight Control System is added and the approach phase of an automatic landing is simulated. A severe turbulence atmospheric environment consisting of wind gusts and wind shears is an integral part of the simulation. A systematic method is presented for developing a Kalman Filter based wind-shear-proofing system to reduce deviations from glide slope caused by wind shears. (Modified author abstract) GRA

**PAPER PILOT** M.S. Thesis

Robert B. Johnson Jun. 1973 155 p refs  
 (AD-764698; GGC/MA/73-2) Avail: NTIS CSCL 01/3

A mathematical model for predicting the pilot rating of an aircraft in a pitch tracking task is described. The model includes the longitudinal-directional aircraft equations of motion, a stochastic gust model, a pilot model with two free parameters, and a pilot rating expression that is a function of rms pitch angle, rms pitch rate, and the pilot lead time constant. The pilot parameters are then adjusted to provide at least a 20% stability margin, and the adjusted pilot parameters are used to compute a Flypaper Pilot rating of the aircraft/gust configuration. The Flypaper Pilot rating was computed for 32 aircraft/gust configurations. A range of actual ratings from 2 to 8 was encountered and the Flypaper Pilot ratings agree quite well with the actual ratings.

**HUMAN FACTORS APPROACH TO AIRCRAFT ACCIDENT ANALYSIS**

Richard H. Shannon and Wayne L. Waag 18 Jun. 1973 46 p refs

(AD-764868; NAMRL-1184) Avail: NTIS CSCL 01/2

Naval Accident reports involving the P-3 and F-4 aircraft were examined over seven and five-year periods, respectively. The critical incident technique was used to catalogue, describe, and analyze operational flight crew errors in both aircraft. An in-depth study was performed in order to identify those problems which were common as well as specific to both aircraft. The P-3 and F-4 aircraft were selected because of their completely different fleet missions and handling characteristics. From the F-4 accident reports, 437 human errors were isolated while the P-3 reports contained 345 errors. Twenty-eight major error categories emerged from the analysis of these errors. The accident reports were further analyzed for the errors which both aircraft had in common. Twenty common error groups were found to occur in the P-3 and the F-4, representing 22.9% and 18.8% of the total errors, respectively. The flight segment of Takeoff/Landing, and the error type of Procedures, shared the most commonality across the two aircraft. The results of this investigation suggest that although common errors can be isolated across highly dissimilar aircraft with highly different flight missions, they comprise a relatively small percentage of total errors. By far, the majority of errors concerned characteristics unique to the particular aircraft in question. Implications in the remedial areas of crew coordination, training, discipline and design are discussed.

(AD-764865; CADCOM-73-6) Avail: NTIS CSCL 01/3

An interactive computer simulation, LARC-I, has been designed to solve the non-linear equations of motion of a generalized VTOL aircraft taking off from or landing on the deck of a ship moving in an irregular or random seaway. This version of LARC-I is limited to longitudinal motions, but is designed for eventual expansion to all degrees of freedom. The LARC-I programs makes use of ship motion amplitudes and frequencies derived separately in a ship motions program, wherein the forcing functions of the seaway are based on a stochastic representation of the waves for any given sea state. The pitching and heaving motions of the ship are transmitted to the aircraft by a realistic simulation of the landing gear. (Modified author abstract) GRA

The problems associated with existing recovery systems include difficulty in mid-air retrieval of RPV's in excess of 1500 lbs; high operations and support costs of parachutes, recovery helicopters, other aircraft and their crews; long recycle time; paying quality requirements for wheeled or skid type landing gear; and frequent damage of RPV's recovered by parachute/attenuation bag or parachute/mid-air recovery systems. Accordingly, this preliminary design study report describes an air cushion landing system (ACLS) applied to the 3,000 lb Jindivik Mk 3A unmanned aircraft. The ACLS is stowed for cruise flight

in a clean aerodynamic fairing on the underfuselage, resulting in a minimum performance degradation. For recovery, hinged clam-shell type doors are unlatched, and open, permitting inflation/deployment of an inelastic type elongated toroid-shaped trunk. The trunk is inflated and blown with bleed air tapped off an existing port on the Jindivik's Viper Mk 201 engine. After landing, the aircraft is placed on a fixture and the trunk is manually restowed in the fairing. (Modified author abstract) GRA

**ELECTRICAL WIRE** Technical Report, Aug. 1971 - Jan. 1973

Lawrence R. Bidwell May 1973 58 p refs  
(AF Proj. 7351)

(AD-764731; AFML-TR-73-113) Avail: NTIS CSCL 09/1

FEP/Polyimide insulated silver-plated copper aircraft electrical wire was thermally aged at temperatures of 150-230C for periods of up to 1000 hrs. The wires were examined for evidence that the insulation contributed to strand blocking during high temperature exposure. No evidence for a reaction between the insulation and the metal conductors was found. The phenomenon can be attributed entirely to the interstrand diffusion of silver. Two types of conductor degradation, unrelated to strand blocking, were identified. The nature, possible cause and probable effect of each is discussed and a change in the current temperature rating procedure is recommended. Author (GRA)

**COCKPIT SWITCHING STUDY: LOGIC AND DESIGN PROCEDURE DEVELOPMENT FOR MULTIFUNCTION MODE SWITCHING CONTROLS** Final Report

D. K. Graham May 1973 76 p refs

(Contract N00014-72-C-0191; NR Proj. 213-088)

(AD-764617; D180-15335-1; JANAIR-730501) Avail: NTIS CSCL 09/1

The purpose of the cockpit switching study was to develop a procedure for design and application of multifunction switching concepts to cockpit controls, and thereby reduce both the number of cockpit switches required and the switching workload of the pilot or aircrew. Such a procedure was developed and is printed under separate cover in a self-guiding handbook format. The procedure is a logical, step-by-step method of consolidating many switching functions on relatively few multifunction switches. The procedure handbook includes appendices containing a review of multifunction switching hardware, and human-engineering design considerations. (Modified author abstract) GRA

**THE APPLICATION OF ENERGY CONCEPTS TO PAVEMENTS** Ph.D. Thesis

William Henry Highter 1972 178 p

Avail: Univ. Microfilms Order No. 73-15817

Pavement engineers have not been able to predict the performance of pavement systems prior to their actual construction and operational utilization. A solution to this problem was obtained by verifying the following hypothesis: There is a functional relationship between the cumulative energy as measured by cumulative peak deflections imparted to a given pavement system and the condition of that system. The hypothesis was tested by applying it to load-deflection and performance trend data gathered in the AASHO Road Test. Regression analysis was performed to find a relationship that predicted the level of the Present Serviceability Index (PSI) as a function of the pavement profile and a measure of the cumulative energy imparted to the pavement. Because of the paucity of airfield condition and deflection data, indirect means had to be used to test the working hypothesis for airfield pavement. Traffic records and construction histories for two Air Force Bases were analyzed. The analysis indicated there is a threshold cumulative total peak deflection at which cracking develops in airfield pavements.

**THE S-4 MODANE HYPERSONIC WIND-TUNNEL: ITS USE FOR AIR BREATHING ENGINE TESTS**

Jean Laverre and Christian Soulier [1973] 10 p refs In FRENCH; ENGLISH summary Presented at 1st Intern. Symp.

on Air Breathing Engines, Marseille, 19-23 Jun. 1972  
Avail: NTIS HC \$3.00

The S4-MA hypersonic wind tunnel is equipped with a Mach 6 nozzle, working at maximum stagnation conditions of 40 bars and 1650 K. The diameter of the free jet test section is 0.68 m. The possibilities offered by the high pressure and temperature air supply system were used for studying the operation of a ramjet supersonic combustion chamber, fed with hydrogen, in the flight conditions. The Mach 6 nozzle was replaced by a duct of appropriate shape, directly connected to the annual intake. Apart from this type of test in closed duct, the wind tunnel permits, with its Mach 6 nozzle, the study of the aerodynamic behavior of large size air intakes, under the actual flight conditions of pressure and temperature. The model may be set in pitch and/or yaw, up to plus or minus 15 deg. The study of a complete airbreathing engine, with its intake and diffuser and with actual flight conditions (Mach 6, 25 km altitude) at intake is possible. The downstream conditions are obtained by using an adequate exhaust system for the combustion gases, either towards spherical vacuum tanks (4000 or 5000 cu m at 0.02 bar) or to atmosphere through a compressed air ejector. (AD-764957; CALSPAN-RK-5070-A-2) Avail: NTIS CSCL 14/2

The familiar technique of accounting for wind-tunnel boundary effects by correcting measured data fails in some of the most important flight regimes, such as the transonic and V/STOL. In such domains, typically strongly nonlinear, it seems necessary that the wind tunnel provide the same flow conditions in the vicinity of the model as in flight, since corrections are virtually impossible. Present-day slotted and perforated tunnels, for example, are intended to do this, but are often inadequate. However, unconfined flow is characterized by certain functional relationships among the flow variables at points on a surface within the tunnel; it is always possible to ascertain whether unconfined-flow conditions are actually present, by measuring such quantities and verifying that these relationships are indeed satisfied. These relationships are independent of the configuration being tested. It is proposed here that wind tunnels be provided with sensors to measure such selected quantities on a convenient surface and means to vary wall geometry so as to approach such conditions in an iterative process. **A DIGITAL COMPUTER-GENERATED CONTACT ANALOG LANDING DISPLAY**

Terry L. Hummel May 1973 92 p refs

(Contract F44620-70-C-0105)

(AD-764764; ARL-73-9/AFOSR-73-5; AFOSR-73-1258TR)

Avail: NTIS CSCL 17/7

A flexible display device was constructed to present a visual landing and navigation display to a pilot. The device makes use of a small digital computer, a flight simulator, and display equipment. A contact analog visual representation of external world objects plus control information is displayed to the pilot. The system is capable of simulating a nighttime approach to an airport and various types of enroute visual information.

**NUMERICAL CALCULATION OF FLOW FIELDS ABOUT RECTANGULAR WINGS OF FINITE THICKNESS IN SUPERSONIC FLOW** Ph.D. Thesis

Jerald Milo Vogel 1973 178 p

Avail: Univ. Microfilms Order No. 73-16985

The inviscid flow fields about a three dimensional rectangular wing of finite thickness at angle of attack with a subsonic tip in a supersonic flow are determined by applying a second order finite difference technique to the gas dynamic equations of motion in their conservative form. The analysis includes a comparison of the second order technique with a current third order method.

**SMALL DISTURBANCE THEORY OF ROTATING SUBSONIC AND TRANSONIC CASCADES**

M. Namba 23 Jun. 1972 45 p refs Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1972; sponsored by Army and AF European Res. Offices, London, by Roy. Soc. of London, and by Cambridge Univ.

Avail: NTIS HC \$4.25

A linearized inviscid, isentropic, three-dimensional flow theory for a rotating thin blade row in a cylindrical duct with subsonic axial flow velocity and subsonic or supersonic relative tip velocity was developed on the basis of pressure dipole representations. A new method of approximation to Fourier Bessel double series was employed to evaluate the singularities. The theory was successfully applied to the inverse problem. Some numerical examples are provided. The validity of the blade element concept is discussed. The essential flow features for transonic compressors are demonstrated.

Murdoch Culley 23 Jun. 1972 33 p refs Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1973.

Avail: NTIS HC \$3.75

An experimental investigation has been conducted into the nature of the flow interference which occurs between a supersonic intake and an airframe in an integrated design of aircraft. It has been shown that an intake pressure field is of ample strength to cause three dimensional separation of a boundary-layer within its influence. The most energy deficient portion of the separated boundary layer is diverted by the separation, to be spilled into the airstream as vortices. A shock wave is generated by the three dimensional separation, and through this the boundary layer is able to influence the intake flow. There is good evidence that the separation shock is not steady.

**STUDY OF SHOCK WAVES PATTERNS IN AN AXIAL SUPERSONIC COMPRESSOR**

Jacques Paulon 19/2 8 p refs In FRENCH; ENGLISH summary Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1973

Avail: NTIS HC \$3.00

Performance and operation stability of a transonic or supersonic compressor are conditioned by the intensity of the shock waves and their position in the blade channels. An experimental facility which, in a small height annular channel, simulates a rotating cascade at supersonic speed, provides optimum conditions to study the shock wave pattern and stability. This facility, using Freon 114 as working gas, includes a window for visualization through which one records instantaneous schlieren shock wave configurations. Outer wall pressure taps give mean pressure repartitions in blade channels and check indications taken from schlieren pictures. Thus, it is possible to show that in function of back pressure, several flow patterns are obtained which extend from entirely supersonic operation in blade channels to rotating stall operation.

**WATER-AUGMENTED VEHICLE (WAVE) STUDY - PHASE 1 Final Report, 5 Jun. - 31 Dec. 1972**

Charles D. Hope-Gill, George Rudinger, Stephen W. Zelazny, and John H. Morgenthaler 1 Mar. 1973 134 p refs (Contract N00014-72-C-0306; NR Proj. 259-097)

(AD-765332) Avail: NTIS CSCL 13/10

The report deals with the analytical investigation of the thrust augmentation, lift forces and mixing properties of a two-phase flow propulsion/lift system which has application to Air Cushion Vehicles (ACV) and Surface Effect Ships (SES). The results of Water-Augmented Vehicles (WAVE) computer program investigations show that significant thrust augmentation can be obtained by the injection of spray inherently produced through the interaction of ACV's and SES's with water surfaces. In addition propulsive efficiencies of 60% can be obtained with relatively quiet operation. The flow model I analysis conducted was based on a modified, one-dimensional duct flow and considered the transverse injection of spray and cushion air into the propulsion duct. Flow pressure losses, leakage of propulsion air from the propulsion duct, droplet breakup and the penetration of spray droplets into the propulsion duct were taken into account.

**THE EFFECT OF REAL PROPERTIES OF AIR ON PARAMETERS OF FLOW NEAR AN ELLIPTIC CONE. AERODYNAMIC CHARACTERISTICS OF ELLIPTIC CONES AT LARGE ANGLES OF ATTACK**

A. P. Bazzhin, O. N. Trusova, and I. F. Chelysheva 27 Jul. 1973 16 p refs Transl. into ENGLISH from Uch. Zap. Tsagi, Tsent. Aerogidrodinam. Inst. (USSR), v. 1, no. 2, 1970 p 46-52

(AD-764945; FTD-HT-23-708-73) Avail: NTIS CSCL 20/4

The calculation results of a flow around a family of elliptic cones by a flow of ideal gas at large angles of attack were presented in previous reports. Subsequently, several variants of flow were calculated taking into account the real properties of air, which are in a state of thermodynamic equilibrium. These calculation results permit one to evaluate the effect of real gas properties, which proves to be insignificant for the variants of flow. The first part of this report is devoted to this problem. Calculated aerodynamic characteristics of elliptic cones over the angle of attack range from 30 degrees to 50 degrees in the case of an ideal gas are presented in the second part of this report.

Samuel A. Elder 31 May 1973 28 p refs

(AD-764851; E-7302) Avail: NTIS CSCL 14/2

The program, in function-modified FOCAL, is specifically designed to enable measurements to be performed on oscillating vertical velocity profiles in the mouth of a flow-excited cavity resonator. Simultaneous hot wire and pressure microphone data samples are recorded at an exact multiple (20X) of the oscillation frequency so as to obtain a synchronous record of the cyclic variation of longitudinal stream velocity at many points in the mouth region. Data is automatically averaged over 100-cycle intervals to remove turbulent background variation. From the stored data, either two or three dimensional velocity profile information can be reconstructed, using sound pressure at the base of the cavity as a phase reference. Options are provided for Fourier analysis, real time (oscilloscope) display, and TTY printout.

**NONLINEAR TRANSIENT ANALYSIS OF MULTI-MASS FLEXIBLE ROTORS - THEORY AND APPLICATIONS**

R. Gordon Kirk and Edgar J. Gunter Washington NASA Sep. 1973 265 p refs

(Grant NGL-47-005-050)

(NASA-CR-2300; ME-4040-112-72U) Avail: NTIS HC \$6.35 CSCL 131

The equations of motion necessary to compute the transient response of multi-mass flexible rotors are formulated to include unbalance, rotor acceleration, and flexible damped nonlinear bearing stations. A method of calculating the unbalance response of flexible rotors from a modified Myklestad-Prohl technique is discussed in connection with the method of solution for the transient response. Several special cases of simplified rotor-bearing systems are presented and analyzed for steady-state response, stability, and transient behavior. These simplified rotor models produce extensive design information necessary to insure stable performance to elastic mounted rotor-bearing systems under varying levels and forms of excitation. The nonlinear journal bearing force expressions derived from the short bearing approximation are utilized in the study of the stability and transient response of the floating bush squeeze damper support system. Both rigid and flexible rotor models are studied, and results indicate that the stability of flexible rotors supported by journal bearings can be greatly improved by the use of squeeze damper supports. Results from linearized stability studies of flexible rotors indicate that a tuned support system can greatly improve the performance of the units from the standpoint of unbalanced response and impact loading. Extensive stability and design charts may be readily produced for given rotor specifications by the computer codes presented in this analysis.

**BALL MOTION AND SLIDING FRICTION IN AN ARCHED OUTER RACE BALL BEARING**

Bernard J. Hamrock [1973] 41 p refs Proposed for submittal to ASME for presentation at the ASME-ASLE Joint Lubrication Conf., Montreal, 8-10 Oct. 1974

(NASA-TM-X-71442; E-7607) Avail: NTIS HC \$4.25 CSCL 131

The motion of the ball and sliding friction in an arched outer race ball bearing under thrust loads is determined. Fatigue life evaluations were made. The analysis is applied to a 150 millimeter bore ball bearing. The results indicated that for high speed-light load applications the arched bearing has significant improvement in fatigue life over that of a conventional bearing. An arching of 0.254 mm (0.01 in.) was found to be an optimal. For an arched bearing it was also found that a considerable amount of spinning occurs at the outer race contacts.

(AD-764787; AFWL-TR-72-151) Avail: NTIS CSCL 13/2

The report presents results for an investigation to develop techniques of nondestructive evaluation of the load-carrying capacity of airfield pavements. Tests were performed with vibratory equipment on pavements where conventional pavement parameters were also measured. Two evaluation approaches, deflection-extrapolation and stiffness methods, are discussed. The nondestructive stiffness method was found to relate to conventional pavement evaluation criteria. Results of the study showed the reliability of the nondestructive pavement evaluation, and a proposed nondestructive evaluation procedure was developed. The equipment used is described in detail, and recommendations are given for improvements to the equipment. Author (GRA)

I. C. Whittaker and S. C. Saunders Wright-Patterson AFB, Ohio AFML Jun. 1973 47 p refs

(Contract F33615-71-C-1134; AF Proj. 7351)

(AD-764775; AFML-TR-73-92) Avail: NTIS CSCL 01/3

A method of simulating crack growth has been investigated. The proposed model, which is based on linear elastic fracture mechanics theory, allows for the variability in crack growth behavior found in the experimental data of various materials. Given a reference stress intensity factor range and central tendency values for the crack growth rate and the exponent of the stress intensity factor excursions of a material in a specified configuration, Monte Carlo simulation is used to select various combinations of parameters. These are then used to generate fatigue cracks, on the assumption that crack growth rate is a power function of the stress intensity factor range. The residual strength of the cracked structure is considered to be a decreasing function of the induced crack length. The probability of crack detection also depends on the generated crack and is assumed to improve with increasing crack length. However, this improved detection probability is modified by the probability that the crack location is not the one being inspected. (Modified author abstract) GRA

**PRINCIPLES OF INCREMENTAL FORGING: PHASE 3 Final Report, Nov. 1971 - May 1973**

T. F. Restivo, A. H. Lonn, and J. A. Schey Jul. 1973 70 p refs

(Contract N00019-72-C-0084)

(AD-764618; Rept-73-4) Avail: NTIS CSCL 13/8

The principles of deformation and of equipment design established in the first two phases formed the basis of development in this third phase of the program. A subpress was designed and built, in which wedge-actuated side rams assured complete synchronization of the vertical (indenting) and horizontal (rib-forming) anvils. Interconnection of the controls of the hydraulic press with those of an electrically actuated manipulator allowed rapid and precise sequencing of deformation increments. The practicability of the process was demonstrated by hot forging 7075 Al and commercial purity titanium into parts with H-sections of 1/4 in. thick ribs and webs, incorporating stiffening cross-ribs. Lubrication became critical in hot forging; on the basis of solid film durability tests, a commercial resin-bonded graphite film

was chosen for lubricating the anvils in forging 7075 Al, and in conjunction with a glass coating applied to the workpiece, also for Ti. (Modified author abstract) GRA

**THE APPLICATION OF ADHESIVE BONDED STRUCTURES AND COMPOSITE MATERIALS ON ADVANCED TURBOFAN ENGINES**

E. M. Pendlebury 23 Jun. 1972 33 p Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1972

Avail: NTIS HC \$3.75

The aero engine industry has a special interest in high temperature adhesives which will withstand environmental exposure more rigorous than most other applications. It is also essential that such systems, be they of glass, carbon, prepreg form, or standard adhesives, are capable of easy production handling and have realistic shelf life properties. There is continuing development in this area and manufacturers of structural adhesives and honeycomb collaborate to a considerable extent with aero engine manufacturers on these subjects. It should be possible in the not too distant future to replace, on a cost basis, existing brazing and welding techniques by bonding, but not until sufficient confidence is gained, which can only be achieved by extensive long term development testing and in-service experience. Alvin Leroy McFarland 1972 280 p

Avail: Univ. Microfilms Order No. 73-15835

The task of selecting a horizontal resolution maneuver is approached from the point of view of optimal control theory, choosing as a performance index to be minimized, the maneuver duration. One aircraft in the conflict maintains a constant velocity path. The problem reduces to that of selecting for the other aircraft the optimum flight path consisting of three circular arcs and two straight legs, which allows the two aircraft to pass with a separation no less than a specific value. The complete theoretical solution to the optimal control problem is stated. Because this exact solution is much too complex for use in practice, a suboptimal solution is proposed, and a means for evaluating the loss of optimality devised. The conflict resolution model and solution could also find application in an automated positive control environment, in a nationwide flow control system, and, with some adaptation, in terminal area metering and spacing schemes. (MTR-6239; FAA-EM-73-4) Avail: NTIS HC \$13.00

Uplink and downlink ATCRBS interference measurements in terminal areas were coordinated with assessments of the sources of these mutual interference conditions. The average values of these observations as well as many burst characteristics corroborated the results of an analytical model coupling the environmental features to their effects on the surveillance system. Simulation efforts based on statistical representation of the input conditions enabled an association of these interference levels with deterioration in performance of the ARTS III and TPX-42 processors. Results of these modeling efforts indicate that the performance of both processors is degraded for transponder reply probabilities below 0.85. Forecasts based on these results indicate that ARTS III performance degradation due to asynchronous interference may limit the terminal area traffic count to about 600 aircraft when approximately 40 interrogators are within view. An evaluation is presented of the approach and landing performance of a Kalman filter aided inertial navigation system using flight data obtained from a series of approaches and landings of the CV-340 aircraft at an instrumented test area. A description of the flight test is given, in which data recorded included: (1) accelerometer signals from the platform of an INS; (2) three ranges from the Ames-Cubic Precision Ranging System; and (3) radar and barometric altimeter signals. The method of system evaluation employed was postflight processing of the recorded data using a Kalman filter which was designed for use on the XDS920 computer onboard the CV-340 aircraft. Results shown include comparisons between the trajectories as estimated by the Kalman filter aided system and as determined from cinetheodolite data. Data start initialization of the Kalman filter, operation at a practical data rate, postflight modeling of sensor errors and operation under the adverse condition of bad data are illustrated. Author

**EVALUATION OF CLOSE-IN/SHORT TURN ON PATTERNS (ILS) Final Report**

Harold R. Richards, Jr. and Frank Parr Washington Aug. 1973 41 p

(AFS Proj. 600-72-3)

(FAA-AFS-500-1) Avail: NTIS HC \$4.25

It was suggested that increased IFR traffic could be accepted at an airport if it were possible for traffic controllers to feed some of the smaller aircraft into gaps in the flow of normal traffic. Flight tests were flown in a Cessna 310 to intercept an ILS localizer at distances of 1.0, 1.5, 2.0, 2.5 and 3.0 NM from the runway threshold to evaluate flyability factors. Nominal airspeed used in maneuvering and on the approach was 110 MPH (100 knots), giving a margin of 9 knots for turbulence over the maximum Category A airspeed of 91 knots. Intercept angles were 45 and 90 degrees to the localizer centerline. Glide slope interception altitude was 500 feet above ground level. All flight tracks were recorded by an APTAR radar system. It was found that ILS intercepts inside the outer marker caused full scale localizer needle deflection during the intercept maneuver, and that pilot opinion did not support implementation of the procedure as a standard operation. H. Frike 1973 18 p In GERMAN Presented at the DGLR-DGON Symp. on Neue Anflug- und Landeverfahren, Duesseldorf, 2-4 May 1973

(DGLR-Paper-73-017) Avail: NTIS HC \$3.00

Two possibilities for improving instrument landing systems were investigated. These deal with interferences during aircraft landing and gliding as a result of multipath propagation and variations of earth surface signal reflectivity. To minimize multipath propagation effects, which can be felt 12 km before touching ground, interference should be detected, and consequently suppressed. Methods to realize these steps are briefly described. Two methods to suppress the variable surface reflection, especially on the glide path are discussed; the formation of quotients in antenna reception signals, and the use of circular polarization. (DGLR-73-019) Avail: NTIS HC \$3.75

Two new instrument landing systems are described. These systems replace ILS, in view of its inherent problems, such as multipath propagation, increasing traffic, equipment volume, and application both in military and civil aviation. The SETAC system, short for sector-Tacan, is based on the military medium range navigation system Tacan and consists of two ground stations and an onboard ancillary device of Tacan equipment. The DLS system is based on DME in the L-band, from which the DME-supported landing system originated. The system allows distance measurements as follows: onboard request, ground transponder, and reply after exactly 50 microsec. The requests are received with special antenna arrays, allowing determination of azimuthal incidence angle, and elevation incidence angle. ESRO

COMPATIBILITY [VERBESSERUNG DES STANDARD-ILS  
UNTER BEIBEHALTUNG DER KOMPATIBILITAET]**

G. Hoefgen 1973 7 p In GERMAN Presented at the DGLR-DGON Symp. on Neue Anflug- und Landeverfahren, Duesseldorf, 2-4 May 1973

(DGLR-Paper-73-018) Avail: NTIS HC \$3.00

Two methods of improving the standard instrument landing system, while retaining compatibility, are presented. The compatible instrument landing system (CILS) consists of the following components: (1) standard ILS for clearance, and (2) microwave ILS 5 GHz, based on conventional principle (90/150 Hz) only for approach sector. To be compatible with the existing two carrier systems with 9 kHz difference carrier frequency, the microwave oscillator frequency is also radiated. The precision instrument landing system (PILS), necessitates more onboard equipment and includes linear antenna arrays, consisting of elements sequentially radiating signals. An advantage over standard ILS is that the glide angle can be selected at random onboard. ESRO

(DGLR-Paper-73-016) Avail: NTIS HC \$4.00

The properties of a flight control display device for producing curved approach profiles, and the flight control along these profiles, are discussed in the case of a microwave instrument landing system. The problems of maneuverability, accuracy, and the stability of aircraft motions are treated, and the requirements of the guide beam system and flight control system are formulated. Flight tests have shown that the methods discussed contribute to reduction of pilot workload. ESRO

The reduction is discussed of the discrete tones generated by jet engines which is essential for jet aircraft to meet present and proposed noise standards. The discrete tones generated by the blades and vanes propagate in the inlet and exhaust duct in the form of spiraling acoustic waves, or spinning modes. The reduction of these spinning modes by the cancellation effect of the combination of two acoustic fields was investigated. The spinning mode synthesizer provided the means for effective study of this noise reduction scheme. Two sets of electrical-acoustical transducers located in an equally-spaced circular array simultaneously generate a specified spinning mode and the cancelling mode. Analysis of the wave equation for the synthesizer established the optimum cancelling array acoustic parameters for maximum sound pressure level reduction. The parameter dependence of the frequency ranges of propagation of single, specified circumferential modes generated by a single array, and of effective cancellation of the modes generated by two arrays, was determined. Substantial sound pressure level reduction was obtained for modes within these limits. Author

**SOME EXPERIMENTS ON THE NOISE EMISSION OF COAXIAL JETS**

Helmut W. Dahlen 23 Jun. 1972 18 p refs Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1972

Avail: NTIS HC \$3.00

The noise emission of coaxial jets or the reduction of jet noise by surrounding a circular primary jet with an annular flow is discussed. Acoustic experiments have been performed with a model hot primary jet which had a Mach number very close to one surrounded by a secondary cold annular flow of variable velocity and area ratios of the coplanar convergent nozzles. The experiments show that the reduction of high frequency noise emission depends on secondary flow velocity. In most cases this reduction seems to be not compensated by an increase in low frequency noise power. The small reduction in the total emitted noise power is uprated by weighting for perceived noise, so that the effects are not more negligible in view of the noise control of jet engines with fair by-pass ratios for SST and military aircraft. Acoustic tests were conducted on a high tip speed (1550 ft/sec, 472.44 m/sec) single stage fan with varying amounts of wall acoustic treatment and with circumferential slots over the rotor blade tips. The slots were also tested with acoustic treatment placed behind the slots. The wall treatment results show that the inlet treatment is more effective at high fan speeds and aft duct treatment is more effective at low fan speeds. Maximum PNL's on a 200-foot (60.96 m) sideline show the untreated slots to have increased the rear radiated noise at approach. However, when the treatment was added to the slots inlet radiated noise was decreased, resulting in little change relative to the solid casing on an EPNL basis. Author

**NOISE COMPARISON OF TWO 1.2-PRESSURE-RATIO FANS WITH 15 AND 42 ROTOR BLADES**

Richard P. Woodward, Frederick W. Glaser, and Joseph A. Wazyniak Washington Oct. 1973 76 p refs

(NASA-TM-X-2891; E-7477) Avail: NTIS HC \$3.75 CSCL 21E

Two 1.829-m-(6-ft-) diameter fans suitable for a quiet engine for future short-takeoff-and-landing (STOL) aircraft were compared. Both fans were designed for a 1.2 pressure ratio with similar weight flows, thrusts, and tip speeds. The first fan, designated QF-9, had 15 rotor blades and 11 stator blades. The rotor was highly loaded and the tip solidity was less than 1. The QF-9 rotor blades had an adjustable pitch feature which can be used for thrust reversal. The second fan, designated QF-6, operated at a moderate loading with a rotor tip solidity greater than 1. Fan QF-6 had 42 rotor blades and 50 stator blades. The low number of rotor blades for QF-9 reduced the frequency of the blade-passage tone below the range of maximum annoyance. In addition to this difference, the QF-9 fan had a somewhat smaller rotor-stator separation than the QF-6 fan. In terms of sound pressure level and sound power level, QF-9 was the noisier fan, with the power level results for QF-9 being about 1 db above those for QF-6 at equivalent operating points as determined by similar stage pressure ratios. At the same equivalent operating points, the maximum perceived noise along a 152.5-m (500-ft) sideline for QF-9 was about 2.5 PNdb below that for QF-6, which indicated that QF-9 was less objectionable to human hearing. The aerodynamic design of an inlet stage for a two-stage, 10/1 pressure ratio, 2 lb/sec flow rate compressor is discussed. Initially a performance comparison was conducted for an axial, mixed flow and centrifugal second stage. A modified mixed flow configuration with tandem rotors and tandem stators was selected for the inlet stage. The term conical flow compressor was coined to describe a particular type of mixed flow compressor configuration which utilizes axial flow type blading and an increase in radius to increase the work input potential. Design details of the conical flow compressor are described. Author

 Helmut F. Butze and David A. Kendall 1973 12 p refs  
 Presented at 9th Propulsion Conf., Las Vegas, Nev., 5-7 Nov. 1973; sponsored by AIAA and Soc. of Automotive Engr.  
 (NASA-TM-X-71429; E-7680) Avail: NTIS HC \$3.00 CSCL 21E

Sensory odor tests of the exhaust from a turbojet combustor operating at simulated idle conditions were made by a human panel sniffing diluted exhaust gas. Simultaneously, samples of undiluted exhaust gas were collected on adsorbent substrates, subsequently removed by solvent flushing, and analyzed chemically by liquid chromatographic methods. The concentrations of the principal malodorous species, the aromatic (unburned fuel-related) and the oxygenated (partially burned fuel) fractions, as determined chromatographically, correlated well with the intensity of the odor as determined by sniffing. Odor intensity increased as combustion efficiency decreased. Combustor modifications which increased combustion efficiency decreased odor intensity.

The effects on stability of steady-state, 180 degree extent circumferential distortions of inlet total temperature and pressure were experimentally determined for a turbojet engine. Results for both individual and combined temperature and pressure distortions are presented showing the losses incurred in stall pressure ratio and are compared with results predicted using a simplified parallel compressor model. The loss due to combined distortions was dependent upon the relative orientation between the low pressure and high temperature regions. Reasonable agreement was achieved between the predicted and observed loss in stall pressure ratio when based on a constant corrected speed relationship.

Results are presented of NASA studies to determine optimum engine cycles for noise levels of 10, 15, and 20 EPNdb below current FAA regulations. The study aircraft were 200-passenger trijets flying over ranges of 5,556 and 10,200 km at cruise speeds of Mach 0.90 to 0.98. The economic impact of reducing noise, the identification of needed advanced technology and the effect of these advances are presented. The studies showed that the noise constraints imposed compromises on the optimum cycle with resulting economic penalties. The application of advanced engine technologies, however, could effectively offset these economic penalties.

An adjustable airfoil is described for varying the geometry of a jet inlet and an ejector inlet in a jet engine for providing thrust augmentation and noise reduction. The airfoil comprises essentially a plurality of segments which are extended radially outwardly and retracted relative to the longitudinal axis of the engine as a function of a change in the pressure differential between the upstream and downstream surfaces of the airfoil. A servo mechanism responsive to the change in the pressure differential is coupled to the airfoil to extend and retract the airfoil segments to maintain the pressure at a maximum on the downstream side of the airfoil relative to the pressure on the upstream side of the airfoil. At low speeds, such as at take-offs and landings, the airfoil is fully extended while at high speeds it is fully retracted.

**PERFORMANCE OPTIMIZATION FOR SUPERSONIC RAMJET THEORETICAL AND EXPERIMENTAL STUDIES**  
 Francis Hirsinger 1972 12 p refs In FRENCH; ENGLISH summary  
 Presented at 1st Intern. Symp. on Air Breathing Engines, Marseille, 19-23 Jun. 1972  
 Avail: NTIS HC \$3.00

Simple theoretical studies show off a combustion process called transition combustion, which is of interest for airbreathing propulsion by means of fixed geometry ramjets, and permits emphasis on some principles for the performance, optimization. During this combustion, which is initiated at subsonic speed, the stream is accelerated, through a thermal throat, up to a supersonic speed. Experimental tests were run which confirm the existence of this phenomenon and have helped to elaborate a mathematical pattern fitted to a proper description of the flow.

This pattern may be used successfully for the prediction of the optimal performances. Computed results show that the so defined configuration leads to competitive performances in a wide domain of flight velocity. Author

**APPLICATION OF THE THEORY OF SIMILITUDE TO THE DESIGN OF CONTROL SYSTEMS FOR GAS TURBINE ENGINES**

Yu. V. Lyubomudrov 25 May 1973 267 p refs Transl. into ENGLISH from Mono. "Primenenie Teorii Podobiya pri Gazoturbinykh Dvigatelyakh" Moscow, 1971 p 1-20 (AD-764683; FTD-HC-23-1340-72) Avail: NTIS CSCL 21/5

The report discusses the questions related to optimum design using the theory of similitude of automatic control systems for aircraft gas turbine engines (GTE) considered as objects with characteristics varying during flight. The equation of motion of the controlled object, expressed in terms of reduced variables, is unique for all conditions of its operation and may be represented as a graph of the dynamic characteristic of a GTE that can be used as a basis to determine the required control laws. The selection of the optimal formula for the control system is done by using power complexes of GTE parameters. A foundation is provided for the principles of designing a single control system that combines higher reliability of control in the entire range of flight conditions with reliability of control. GRA

Exhaust emissions were measured in the plume of a J85-GE-5 turbojet engine as part of an investigation to determine the impact on the climate of a fleet of supersonic aircraft flying in the stratosphere. Measurements were made for both military and partial afterburning power at Mach numbers and simulated

altitudes of Mach 1.6/55,000 ft and Mach 2.0/65,000 ft. A continuous sampling technique was used to measure carbon dioxide, carbon monoxide, total unburned hydrocarbons, oxides of nitrogen, and particulates. The experimental results were compared with the calculated emission profiles and were in good agreement. The results represent the only available full-scale turbojet engine emission data to date which have been obtained at simulated high altitude with a supersonic external stream. **A COMPUTER PROGRAM FOR AXIAL COMPRESSOR DESIGN. VOLUME 1: THEORY DESCRIPTIONS, AND USERS INSTRUCTIONS** Final Technical Report, 16 Jun. 1972 - 15 Jun. 1973

Richard M. Hearsey Jul. 1973 96 p refs 2 Vol. (Contract F33615-72-C-2026; AF Proj. 3066; AF Proj. 7065) (AD-764733; AFAPL-TR-73-66-Vol-1) CSCL 21/5

A computer program for the design of axial compressors is presented. It comprises of three principal sections, two alternative means of determining blade geometry, and an aerodynamic computation for the flow through the compressor. One method of determining blade geometry revolves around the use of various analytic meanlines for the blade sections, and leads to the aerodynamic analysis of the flow through specified blading. The other method consists of creating arbitrary blade sections to follow the flow directions previously determined in an aerodynamic design calculation. The aerodynamic design section incorporates a loss calculation routine that may be used to estimate the design point performance of the compressor. The report describes the computer program, and gives all information necessary to use it. (Modified author abstract) GRA

**THE DESIGN OF AXIAL COMPRESSOR AIRFOILS USING ARBITRARY CAMBER LINES** Final Report

George R. Frost and Arthur J. Wennerstrom Jul. 1973 106 p refs (AF Proj. 7065)

(AD-765165; ARL-73-0107) Avail: NTIS CSCL 21/5

The report describes a technique which has been developed for use in the design of axial compressor airfoils with camber lines of arbitrary shape. The slope of the camber line at several points on a streamsurface is determined from the air angles at these points as well as the incidence and deviation angle distributions for the blade. A camber line is produced by fitting a smooth curve segment through each pair of points from the leading to the trailing edge. A thickness distribution is applied to this camber line to produce the blade element. A computer program, which uses this technique to produce blade elements, stacks them, and then determines coordinates for plane surfaces through the resultant blade is also described.

**INVESTIGATION OF AIRCRAFT GAS TURBINE COMBUSTOR HAVING LOW MASS EMISSIONS Final Report**

D. L. Troth, A. J. Verdouw, and F. J. Verkamp Fort Eustis, Va. Army Air Mobility Res. and Develop. Lab. Apr. 1973 730 p refs

(Contract DAAJ02-72-C-0005; DA Proj. 1G1-62207-AA-71) (AD-764987; ERD-7725; USAAMRDL-TR-73-6) Avail: NTIS CSCL 13/2

The objective of this one-year program was to develop and demonstrate emission abatement technology sufficient to obtain a 50% overall reduction in gas turbine engine mass emissions (CO, CxHy, NOx and smoke) with no increase in any individual pollutant when tested over a typical Army light observation helicopter (LOH) duty cycle. The selected baseline was the Army T63-A-5A gas turbine engine combustor. Seventeen potential low-emission combustors, each incorporating one or more of the selected concepts, were tested to determine their emission performance. Experimental results indicated that several designs had the potential for meeting the program objectives. Two combustors selected for final experimental evaluation were the Prechamber and Modified Conventional. The low-emission feature in the Prechamber combustor was premix/prevaporization. The Modified Conventional combustor incorporated four low-emission features: airblast fuel atomization, delayed dilution, convection cooling, and variable geometry. Both of these combustors met the emission reduction objectives. Experimental results indicated that both of these liners can be developed to meet all other conventional T63 combustor requirements, i.e., light-off, temperature profile, durability, etc. The estimated development time for the Prechamber is longer than for the Modified Conventional. However, the Prechamber combustor has better emission reduction potential when both combustors are designed as either fixed or variable geometry combustors. (Modified author abstract) GRA

**EFFECT OF INLET-AIR HUMIDITY, TEMPERATURE, PRESSURE, AND REFERENCE MACH NUMBER ON THE FORMATION OF OXIDES OF NITROGEN IN A GAS TURBINE COMBUSTOR**

Nicholas R. Marchionna, Larry A. Diehl, and Arthur M. Trout Washington Oct. 1973 34 p refs

(NASA-TN-D-7396; E-7465) Avail: NTIS HC \$3.00 CSCL 21B

Tests were conducted to determine the effect of inlet air humidity on the formation of oxides of nitrogen (NOx) from a gas turbine combustor. Combustor inlet air temperature ranged from 506 K (450 F) to 838 K (1050 F). The tests were primarily run at a constant pressure of 6 atmospheres and reference Mach number of 0.065. The NOx emission index was found to decrease with increasing inlet air humidity at a constant exponential rate:  $NOx = NOx_0 e^{-19H}$  (where H is the humidity

and the subscript 0 denotes the value at zero humidity). The emission index increased exponentially with increasing normalized inlet air temperature to the 1.14 power. Additional tests made to determine the effect of pressure and reference Mach number on NOx showed that the NOx emission index varies directly with pressure to the 0.5 power and inversely with reference Mach number. **PROCEEDINGS OF THE NASA/MIT WORKSHOP ON AIRLINE SYSTEMS ANALYSIS, VOLUME 1**

Joseph F. Vittek, ed. Jul. 1972 744 p refs Workshop held at Waterville Valley, New Hampshire, 10-21 Jul. 1972 2 Vol. (Contract NASw-2412)

(NASA-CR-135634; FTL-R72-7-Vol-1) Avail: NTIS HC \$39.25 CSCL 05C

Economic principles, financial aspects, forecast and demand, and marketing in the development of an air transport industry are considered.

**N73-32849\*** Massachusetts Inst. of Tech., Cambridge.

**DEVELOPMENT OF THE AIR TRANSPORT INDUSTRY**

Nawal Taneja In its Proc. of the NASA/MIT Workshop on

Airline Systems Analysis, Vol. 1 Jul. 1972 p 1-44 refs

# CSCS 05C

The major developments are outlined in the U.S. scheduled air transport industry both domestic and international, together with a brief history of the European air transport system. The role and formulation of the U.S. Civil Aeronautics Board, International Civil Aviation Organization, and International Air Transport Association are also covered. Author

**N73-32850\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.

## THE ROLE OF THE FEDERAL GOVERNMENT IN THE DEVELOPMENT OF THE US AIR TRANSPORTATION SYSTEM

Joseph F. Vittek *In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 27 p*

# CSCS 05A

Reviewed are the roles of the various Federal agencies in the regulation, control, and development of the Air System, with major emphasis on the Department of Transportation (Office of the Secretary, Federal Aviation Administration, and National Transportation Safety Board) and the Civil Aeronautics Board. Author

**N73-32851\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.

## AN ANALYSIS OF AIRLINE COSTS. LECTURE NOTES FOR MIT COURSES. THE 16.73 AIRLINE MANAGEMENT AND MARKETING

Robert W. Simpson *In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 43 p refs*

# CSCS 05A

The cost analyst must understand the operations of the airline and how the activities of the airline are measured, as well as how the costs are incurred and recorded. The data source is usually a cost accounting process. This provides data on the cumulated expenses in various categories over a time period like a quarter, or year, and must be correlated by the analyst with cumulated measures of airline activity which seem to be causing this expense. Author

**N73-32852\*** Massachusetts Inst. of Tech., Cambridge.

## THE ATA-67 FORMULA FOR DIRECT OPERATING COST

Henry B. Faulkner *In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 18 p refs*

# CSCS 05C

The ATA formulas for direct operating cost were developed for the purpose of comparing different aircraft, existing or not, on the same route or the same aircraft on different routes. Such characteristics of the airline as crew pay, maintenance procedures, and depreciation schedules are kept constant. In air transportation systems analysis the 1967 ATA formula is usually used with appropriate exceptions or modifications, such as: different maintenance labor rate, total maintenance multiplied by a factor, maintenance burden deleted, different depreciation schedule, or different spares percentages. Author

## TECHNOLOGY FOR DESIGN OF TRANSPORT AIRCRAFT. LECTURE NOTES FOR MIT COURSES: SEMINAR 1.61

## FRESHMAN SEMINAR IN AIR TRANSPORTATION AND GRADUATE COURSE 1.201. TRANSPORTATION SYSTEMS ANALYSIS

Robert W. Simpson *In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 50 p*

# CSCS 01C

The design parameters which determine cruise performance for a conventional subsonic jet transport are discussed. It is assumed that the aircraft burns climb fuel to reach cruising altitude and that aeronautical technology determines the ability to carry a given payload at cruising altitude. It is shown that different sizes of transport aircraft are needed to provide the cost optimal vehicle for different given payload-range objectives. G.G.

**N73-32854\*** Harvard Univ., Cambridge, Mass. Dept. of Economics.

## BASIC ECONOMIC PRINCIPLES

T. Nicholas Tideman *In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 7 p refs*

# CSCS 05C

An economic approach to design efficient transportation systems involves maximizing an objective function that reflects both goals and costs. A demand curve can be derived by finding the quantities of a good that solve the maximization problem as one varies the price of that commodity, holding income and the prices of all other goods constant. A supply curve is derived by applying the idea of profit maximization of firms. The production function determines the relationship between input and output. G.G.

**N73-32855\*** Massachusetts Inst. of Tech., Cambridge.

## BASIC TRANSPORTATION ECONOMICS

James T. Kneafsey *In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 18 p refs*

# CSCS 05C

Transportation economics is an integral part of all transportation activities. Refined, detailed, and careful economic analyses consider conduct-performance methodology and the specifications of production, cost and demand functions. Author

**N73-32856\*** Texas A&M Univ., College Station.

## DETERMINATION OF FARES: PRICING THEORY AND ECONOMIC EFFICIENCY

James C. Miller, III *In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 30 p refs*

# CSCS 05C

The concept of economic efficiency is described, its application to the pricing of air transport services, and its relevance as a policy objective are outlined. The first two sections discuss economic efficiency in general terms, whereas the third applies this norm to several airline pricing problems. The final section emphasizes the importance of industry behavior as a parameter in policy analysis. Author

**N73-32857\*** United Air Lines, Inc., Chicago, Ill.

## DIFFERENTIAL PRICING POLICY

J. B. Gebhardt *In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 15 p*

# CSCS 05C

Differential pricing is a valid means of improving profits, keeping the total cost of air transportation down, and making it possible for more people to use air transportation. Author

**N73-32858\*** United Air Lines, Inc., Chicago, Ill.  
**THE ECONOMIC EFFECT OF COMPETITION IN THE AIR TRANSPORTATION INDUSTRY**  
 Herbert B. Hubbard /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 25 p

CSCS 05C

The air transportation industry has been described as a highly-competitive, regulated oligopoly or as a price-regulated cartel with blocked entry, resulting in excessive service and low load factors. The current structure of the industry has been strongly influenced by the hypotheses that increased levels of competition are desirable per se, and that more competing carriers can be economically supported in larger markets, in longer haul markets, with lower unit costs, and with higher fare levels. An elementary application of competition/game theory casts doubt on the validity of these hypotheses, but rather emphasizes the critical importance of the short-term non-variable costs in determining economic levels of competition. Author

**N73-32859\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.  
**BASIC FINANCE**  
 Joseph F. Vittek /In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 66 p

CSCS 05C

A discussion of the basic measures of corporate financial strength, and the sources of the information is reported. Considered are: balance sheet, income statement, funds and cash flow, and financial ratios. Author

**N73-32860\*** Air Transport Association of America, Washington, D.C.  
**CAPITAL REQUIREMENTS FOR THE AIR TRANSPORT INDUSTRY**  
 George W. James /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 13 p

CSCS 05C

In recent years the U.S. scheduled airline industry has been involved in the largest re-equipment program that involves the addition of hundreds of new aircraft to the airline fleet. The costs associated with the purchase of this new equipment, along with the other costs involving such matters as the environment and security, are presenting the carriers with significant financial challenges. Author

**N73-32861\*** American Airlines, Inc., New York.  
**FINANCING THE AIR TRANSPORTATION INDUSTRY**  
 D. J. Lloyd-Jones /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 50 p

CSCS 05C

The basic characteristics of the air transportation industry are outlined and it is shown how they affect financing requirements and patterns of production. The choice of financial timing is imperative in order to get the best interest rates available and to insure a fair return to investors. The fact that the industry cannot store its products has a fairly major effect on the amount of equipment to purchase, the amount of capital investment required, and the amount of return required to offset industry depreciation. G.G.

**N73-32862\*** Export-Import Bank, Washington, D.C.  
**THE ROLE OF THE EXPORT-IMPORT BANK IN DEVELOPING**

**ING THE EXPORT POTENTIAL OF AIRCRAFT SALES**  
 Chosei Kuge /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 1972 11 p

CSCS 05C

A description of the current patterns, terms, and conditions of Eximbank commercial jet aircraft export financing is given. Some discussion of the factors affecting export financing will be noted. Author

**N73-32863\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.  
**THE MARKET DEMAND FOR AIR TRANSPORTATION**  
 Nawal Taneja /In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 65 p refs

CSCS 05C

Although the presentation will touch upon the areas of market for air transportation, the theoretical foundations of the demand function, the demand models, and model selection and evaluation, the emphasis of the presentation will be on a qualitative description of the factors affecting the demand for air transportation. The presentation will rely heavily on the results of market surveys carried out by the Port of New York Authority, the University of Michigan, and Census of Transportation. Author

**N73-32864\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.  
**TECHNIQUES FOR FORECASTING AIR PASSENGER TRAFFIC**  
 Nawal Taneja /In its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 16 p refs

CSCS 05A

The basic techniques of forecasting the air passenger traffic are outlined. These techniques can be broadly classified into four categories: judgmental, time-series analysis, market analysis and analytical. The differences between these methods exist, in part, due to the degree of formalization of the forecasting procedure. Emphasis is placed on describing the analytical method. Author

**N73-32865\*** International Civil Aviation Organization, Montreal (Quebec).  
**AVIATION FORECASTING IN ICAO**  
 James McMahon /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 20 p

CSCS 05A

Opinions or plans of qualified experts in the field are used for forecasting future requirements for air navigational facilities and services of international civil aviation. ICAO periodically collects information from States and operates on anticipated future operations, consolidates this information, and forecasts the future level of activity at different airports. Author

**N73-32866\*** American Airlines, Inc., New York.  
**AMERICAN AIRLINES PROPELLER STOL TRANSPORT ECONOMIC RISK ANALYSIS**  
 Bob Ransone /In MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 27 p

CSCS 05C

A Monte Carlo risk analysis on the economics of STOL transports in air passenger traffic established the probability of

making the expected internal rate of financial return, or better, in a hypothetical regular Washington/New York intercity operation. G.G.

**N73-32869\*** Harvard Univ., Cambridge, Mass.  
**DETERMINANTS OF MARKET STRUCTURE AND THE AIRLINE INDUSTRY**

William Raduchel *In* MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 20 p

**CSCL 05A**

The general economic determinants of market structure are outlined with special reference to the airline industry. Included are the following facets: absolute size of firms; distributions of firms by size; concentration; entry barriers; product and service differentiation; diversification; degrees of competition; vertical integration; market boundaries; and economies of scale. Also examined are the static and dynamic properties of market structure in terms of mergers, government policies, and economic growth conditions. Author

**N73-32870\*** Massachusetts Inst. of Tech., Cambridge.

**OBJECTIVES OF THE AIRLINE FIRM: THEORY**

James T. Kneafsey *In* its Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 14 p

**CSCL 05A**

Theoretical models are formulated for airline firm operations that revolve around alternative formulations of managerial goals which these firms are pursuing in practice. Consideration is given to the different objective functions which the companies are following in lieu of profit maximization. G.G.

**N73-32871\*** North Carolina Univ., Chapel Hill.

**PROBLEMS OF EXCESS CAPACITY**

George Douglas *In* MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 15 p

**CSCL 05A**

The problems of excess capacity in the airline industry are discussed with focus on the following topics: load factors; fair rate of return on investment; service-quality rivalry among airlines; pricing (fare) policies; aircraft production; and the impacts of excess capacity on operating costs. Also included is a discussion of the interrelationships among these topics. Author

**N73-32872\*** Douglas Aircraft Co., Inc., Long Beach, Calif.

**THE ROLE OF THE MANUFACTURER IN AIR TRANSPORTATION PLANNING**

James MacKenzie *In* MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 40 p

**CSCL 05A**

The role of the aircraft manufacturer in the airline industry is considered. The process is illustrated by using a fictitious airline as an example--that is, a case study approach with Mid-Coast Airways serving as the example. Both in slide form and with supporting papers, a brief history of the airline, a description of its route structure and a forecast based on econometric analysis are presented. Once the forecast rationale is explained, information outlines the requirements for additional aircraft and the application of new aircraft across the system using alternative fleet plan options. The fleet plan is translated into financial summaries which indicate the relative merit of alternative aircraft types or operating plans. Author

**N73-32873\*** Pan American World Airways, Inc., New York.  
**CONSUMER MARKETING AND THE AIRLINE INDUSTRY**  
 William R. Roy *In* MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 21 p

**CSCL 05A**

The fundamentals of consumer marketing as applied to the airline industry are considered. An attempt is made to boil down the mystique and jargon which frequently surround the subject of marketing. Topics covered include: (1) The marketing concept; (2) consumer expectations from airlines; (3) planning of marketing strategy; and (4) the roles of advertising, sales, and middlemen. Author

**N73-32874\*** Pan American World Airways, Inc., New York.  
**FUTURE DIRECTION IN AIRLINE MARKETING**

Dan A. Colussy *In* MIT Proc. of the NASA/MIT Workshop on Airline Systems Analysis, Vol. 1 Jul. 1972 20 p

**CSCL 05A**

The rapid growth and broadening of the air travel market, coupled with a more sophisticated consumer, will dramatically change airline marketing over the next decade. Discussed is the direction this change is likely to take and its implications for companies within the industry. New conceptualization approaches are required if the full potential of this expanding market is to be fully realized. Marketing strategies are developed that will enable various elements of the travel industry to compete not only against each other but also with other products that are competing for the consumer's discretionary income. Author

**MIT-NASA WORKSHOP AIRLINE SYSTEMS ANALYSIS, VOLUME 2**

Jul. 1972 602 p refs

(Contract NASw-2412)

(NASA-CR-135635; FTL-R72-7-Vol-2) Avail: NTIS HC \$32.25 CSCL 05A

The proceedings of a conference on the Air Transport Industry are presented. The subjects discussed are: (1) analysis of airline costs, (2) transportation economics, (3) airline financing, (4) market demand for air transportation, (5) planning, management, and economics of airport operation, (6) air cargo operations, (7) commuter aircraft operations, (8) regulation of air traffic rates, (9) airline merger policies, and (10) international air transportation operations.

**N73-32876\*** Massachusetts Inst. of Tech., Cambridge.  
**CONCENTRATION OF AIRLINE OPERATIONS AT INDIVIDUAL AIRPORTS**

W. Gelerman and R. DeNeufville *In* its MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 29 p refs

**CSCL 01E**

It is shown that it is a natural property of air transportation networks for competitive airlines to concentrate their operations at individual airports serving a given market. This implies that a strategy of developing satellite airports is doomed to failure unless the competitive behavior of the airlines is restricted. The results are demonstrated by tracing out the implications of observed patterns of traveller behavior as regards choice of carrier on the optimal game strategy for any particular airline. Analytic results for a two airline, two airport situation are extrapolated to the more general case, and specific supportive evidence from current operations are cited. Author

**N73-32877\*** Massachusetts Inst. of Tech., Cambridge.  
**PLANNING, MANAGEMENT, AND ECONOMICS OF AIRPORT OPERATION**  
 John Wiley / In its MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 18 p

**CSSL 05A**

An overview of the role of the airport in the transportation complex and in the community is presented. The establishment of the airport including its requirements in regional planning and the operation of the airport as a social and economic force are discussed. Author

**N73-32878\*** Port of New York Authority, N.Y.  
**AIRPORT ECONOMICS: MANAGEMENT CONTROL FINANCIAL REPORTING SYSTEMS**  
 Allen Buchbinder / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 16 p

**CSSL 05B**

The development of management control financial reporting systems for airport operation is discussed. The operation of the system to provide the reports required for determining the specific revenue producing facilities of airports is described. The organization of the cost reporting centers to show the types of information provided by the system is analyzed. Author

**N73-32879\*** Port of New York Authority, N.Y. Aviation Economics Div.  
**AIR TRAFFIC FORECASTING AT THE PORT AUTHORITY OF NEW YORK AND NEW JERSEY**  
 Johannes G. Augustine / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 23 p refs

**CSSL 05A**

Procedures for conducting air traffic forecasts with specific application to the Port Authority of New York and New Jersey are discussed. The procedure relates air travel growth to detailed socio-economic and demographic characteristics of the U.S. population rather than to aggregate economic data such as Gross National Product, personal income, and industrial production. Charts are presented to show the relationship between various selected characteristics and the use of air transportation facilities. Author

**N73-32880\*** Massachusetts Port Authority, Boston.  
**ROUTE AWARD CONSIDERATIONS**  
 Wilson D. Rogers, Jr. / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 22 p

**CSSL 05A**

The organization, responsibilities, and functions of the Civil Aeronautics Board are discussed. Several examples of decisions made by the Civil Aeronautics Board on the award of specific air routes to competing air lines are presented. The manner in which route proceedings are initiated and examined is explained. Recommendations are made concerning actions which can be taken to improve the services provided to the flying public. Author

**N73-32881\*** Eastern Air Lines, Inc., Miami, Fla. Cargo Sales and Services.  
**THE ECONOMICS OF AIR CARGO**

John W. Kersey / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 14 p

**CSSL 05A**

The economic factors involved in air cargo operations and air cargo marketing development are discussed. Specific steps which are followed by various airports to reduce operating costs are described. The economics of cargo handling within an airline are analyzed with respect to: (1) paperwork costs, (2) terminal costs, (3) line haul costs, and (4) claims costs. Author

**N73-32882\*** Eastern Air Lines, Inc., Miami, Fla.  
**AIR CARGO MARKETING DEVELOPMENT**  
 John W. Kersey / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 12 p

**CSSL 05A**

The factors involved in developing a market for air cargo services are discussed. A comparison is made between the passenger traffic problems and those of cargo traffic. Emphasis is placed on distribution analyses which isolates total distribution cost, including logistical costs such as transportation, inventory, materials handling, packaging, and processing. Specific examples of methods for reducing air cargo costs are presented. Author

**N73-32883\*** Civil Aeronautics Board, Washington, D.C.  
**CURRENT PROBLEMS AND ISSUES IN AIR FREIGHT RATES**  
 Alfred R. Stout / In MIT MIT-NASA Workshop on Airline Systems Analysis, Vol. 2 Jul. 1972 21 p

**CSSL 05C**

Actions of the Civil Aeronautics Board in determining air freight rates are discussed. The tariff filings by domestic airlines for making basic changes in domestic fares and rates are reported. The roles of the carriers and the Civil Aeronautics Board in establishing freight rates are defined. Specific examples of areas of controversy in establishing freight rates are included. Methods for improving the air cargo and freight rate situation are proposed. Author

**N73-32884\*** Massachusetts Inst. of Tech., Cambridge. Flight Transportation Lab.  
**THE FUTURE OF THE US DOMESTIC AIR FREIGHT INDUSTRY**  
 Lewis M. Schneider / In its MIT-NASA Workshop on Airlines Systems Analysis, Vol. 2 Jul. 1972 21 p refs

**CSSL 05A**

A research project on the future of U.S. domestic air freight operations was conducted. The two main subjects of the project were: (1) during the 1965 to 1969 time period, when the airlines introduced jet freighters into domestic service and air freight traffic growth continued at a high rate, what strategies were employed by management and with what results and (2) what are the opportunities and problems confronting the domestic air freight industry during the 1970 and 1980 time period. The results of the analysis are presented in the form of graphs and tables. Author

**VULNERABILITY OF DRY BAYS ADJACENT TO FUEL TANKS UNDER HORIZONTAL GUNFIRE** Technical Report, Mar. 1966 - Jun. 1971

Robert G. Clodfelter Mar. 1973 102 p refs (AF Proj. 3048)

(AD-764732; AFAPL-TR-72-83) Avail: NTIS CSCS 19/4

The report deals with the relative vulnerability to incendiary action of dry bays adjacent to fuel tanks as a function of fuel type. Cal 50 API horizontal gunfire was the threat; a high level

of simulation was achieved by having air flow external to and in the dry bays. The results of a wide range of test conditions are presented. The overall conclusion of the investigation was that JP-8 fuel is less susceptible to fire and explosion induced by gunfire and should produce less aircraft structural damage than JP-4. Author (GRA)

**ANALYSIS OF THE LOW-SPEED FLOW OVER A SLENDER SHARP-EDGED DELTA WING AT ANGLES OF ATTACK** Ph.D. Thesis

Paul LeRoy Coe 1973 75 p

Avail: Univ. Microfilms Order No. 73-19383

The phenomena of rolled-up vortex cores above the lee surface of slender bodies, at angle of attack, has been observed since the advent of the highly swept-wing aircraft. Investigations indicate that these vortices exhibit large effects on the longitudinal and lateral stability of these configurations. Because of its geometric simplicity, an untwisted, uncambered, thin, sharp-edged, slender delta wing in subsonic flow is considered. Experimental studies have established the essential features of this type of flow as follows: (1) separation of flow at the leading edges, (2) formation of rolled-up vortex cores above the lee surface, (3) entrainment of mass by the vortex cores, (4) strong axial velocities along the vortex cores and (5) conical flow over the major portion of the wing (with the exception of the apex and trailing edge).

**AERODYNAMIC FORCES ON OBJECTS IN THE NEARLY FREE MOLECULAR FLOW REGIME** Ph.D. Thesis

William Aaron Kuperman 1972 187 p

Avail: Univ. Microfilms Order No. 73-18251

The drag of an object moving in a rarefied gas is discussed. The first (inverse) Knudsen number correction to the drag in the free molecular flow regime is determined by a set of collision integrals associated with the dynamics of two gas molecules in the presence of the object. These collision integrals are analogous to the three-particle collision integrals derived earlier for the transport properties of a moderately dense gas if one of the particles is replaced with the object. Collision integrals for a number of cases assuming a gas of hard sphere molecules which scatter diffusively with the object are calculated. For a sphere moving at low velocity the result is in agreement with Millikan's data for the drag coefficient of oil droplets. For a cylinder and a strip the coefficient of a term logarithmic in the expansion parameter is obtained. Dissert. Abstr.

**WING TIP VORTEX MEASUREMENTS WITH LASER DOPPLER SYSTEMS**

Charles E. Fuller, III Apr. 1973 79 p refs

(Contract NAS8-25896)

(NASA-CR-124444; RTR-002-3) Avail: NTIS HC \$6.00 CSCS 01A

The vortex velocity field produced by a rectangular wing in a subsonic wind tunnel was measured using two laser Doppler velocimeter systems. One system made three dimensional mean velocity measurements and the other made one dimensional turbulence measurements. The systems and test procedures are described and comparisons of the measurements are made. The data defined a strong spiral motion in the vortex formation process. Author

**AN EXPERIMENTAL INVESTIGATION OF THREE OBLIQUE-**

# **WING AND BODY COMBINATIONS AT MACH NUMBERS BETWEEN 0.60 AND 1.40**

Lawrence A. Graham, Robert T. Jones, and Frederick W. Boltz  
Apr. 1973 173 p refs

(NASA-TM-X-62256) Avail: NTIS HC \$10.75 CSCL 01A

An experimental investigation was conducted in an 11- by 11-foot transonic wind tunnel to determine the aerodynamic characteristics of three oblique high aspect ratio wings in combination with a high fineness-ratio Sears-Haack body. The three wings had the same elliptical planform and base line curvature but had different airfoil sections. One wing had an airfoil section designed to have a lift coefficient of 1.0 at a Mach number of 0.7, another to have shock-free supersonic flow over the upper surface, and the other to have a lift coefficient of 1.3 at a Mach number of 0.6. Longitudinal and lateral-directional stability data were obtained at wing yaw angles of 0 deg, 45 deg, 50 deg, and 60 deg over a test Mach number range from 0.6 to 1.4 for angles of attack between minus 7 deg and 9 deg. Reynolds numbers for the study were 4 and 6 million per foot. Flow-visualization studies were made to examine the nature of the flow on the wing surfaces. Notable differences were found in the aerodynamic characteristics of the three wing-body combinations, particularly in the lateral-directional characteristics.

# **RELATIVE FREQUENCY OF OCCURRENCE OF DIFFERENT NORMAL ACCELERATIONS AT THE CENTRE OF GRAVITY OF AIRCRAFT IN TURBULENCE**

J. Taylor London Aeron. Res. Council 1973 60 p refs  
Supersedes RAE-TR-71169; ARC-33503

(ARC-R/M-3714; RAE-TR-71169; ARC-33503) Avail: NTIS HC \$5.00; HMSO £ 2.15; PHI \$8.33

An examination is made of the relative frequency of occurrence of different normal accelerations, at points near the aircraft centre of gravity of 5 different aircraft, from about 200 hours of research flying sub-divided into about 12000 time periods mainly of about 1 minute. It is shown that the commonly used assumption of a Rayleigh distribution for vertical gust velocity maxima for each period gives poor estimates of the cumulative totals of all the periods for each aircraft. If, however, it is assumed that (1) the frequency of occurrence of different magnitudes of the maxima of the gust velocity vector is a Rayleigh distribution, and (2) the vector changes direction sufficiently slowly for the maxima of the components to occur at the same time as the maxima of the vector, hold for each period, the estimates of the cumulative totals of all the periods for each aircraft do not differ significantly from the measurements.

HC \$4.25; HMSO £ 1.70; PHI \$6.75

Results are presented of dynamic tests on two model half-wings performing pitching oscillations in a tunnel which has a slotted roof and floor with perforations of variable size behind the slots. A porosity is found which gives small interference for all speeds in the range of Mach numbers from 0.40 to 1.05 and a method is suggested for selecting a wall porosity to give interference-free damping derivatives; interference-free stiffness derivatives are not simultaneously obtained and small corrections to measured values are required.

Model wings of various planforms were plunged vertically into a water tank and the vortex patterns on the surface were studied. For each wing the wake drift rate was found to increase with incidence and to decrease with increasing core separation. The wake started off with discrete vortex cores which grew independently, maintained their initial separation, and had peak velocities which decayed as time to the minus one-half power. The edges of the cores ultimately came very close together, and thereafter separation distance between the core centers increased with time, and the peak velocities tended to decay at the reciprocal of time.

# **STUDY OF BUFFETING MOTION OF AIR CUSHION VEHICLES [ETUDE DU MOUVEMENT DE PILONNEMENT DES VEHICULES A COUSSAIN D'AIR]**

G. VandeSteen 1973 103 p refs In FRENCH  
(NT-33-1973) Avail: NTIS HC \$7.25

An aerothermodynamical study of buffeting for three types of air cushion vehicle is presented. The main hypotheses are given. A theoretical study for the skirt type vehicle leads to a third order differential equation from which the stability criterion is derived. Experimental tests show the importance of fan characteristics, quasi uniform flow within the skirt, compressibility effects, and non-linear effects. The peripheral jet type may be represented by a second order linear system using a modified Crewe Eddington potential theory with a good approximation.

The two pressure stage vehicle combines both types above. By combining experimental results and theory, a satisfactory approximation was obtained. In all three cases the transient response is damping coefficient lower than the critical value.

**SHORT-HAUL TRANSPORTATION IN THE 1980'S**

Leonard Roberts *In its* STOL Technol. 1972 p 1-8 refs

**CSCL 01C**

The requirements for short-haul air transportation services in the 1980 time period are analyzed. The identification of short takeoff and landing aircraft to perform this service is reviewed. The adequacy of technical programs for developing short-haul aircraft is examined. The characteristics of several candidate short-haul aircraft are described. A system analysis, to include the economic and environmental factors, is developed. Author

**N73-32936\*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**FUTURE SHORT-FIELD AIRCRAFT**

Thomas L. Galloway *In its* STOL Technol. 1972 p 9-22 ref

**CSCL 01C**

The application of short takeoff and landing aircraft for improving short-haul air transportation is examined. The contracts with industry to study quiet turboprop short-field aircraft in the short-haul air transportation system are identified. Studies of appropriate propulsion systems are conducted in parallel with the aircraft studies. The objectives of the studies are to: (1) determine economic and social viability of short-haul air transportation, (2) identify critical technology and technology-related problems, (3) define representative aircraft configurations and characteristics to include development and operational costs, and (4) to establish desirable technology advances for improving short-haul transportation systems. **AERODYNAMIC CHARACTERISTICS OF A SWEEP AUGMENTOR WING**

David G. Koenig and Michael D. Falarski (Army Air Mobility R and D Lab.) *In its* STOL Technol. 1972 p 71-86 refs

**CSCL 01A**

A brief outline of augmentor wing research sponsored by Ames Research Center is presented and is followed by a discussion of large-scale wind-tunnel test results for a swept augmentor wing configuration. The results showed that the augmentor wing could be applied to high-speed swept wing designs with little adverse effect on either the basic performance of the augmentor or the longitudinal characteristics, including maximum lift and stall. Three lateral control devices were shown to be effective and ground effect was measured for several complete aircraft configurations. Author

**N73-32942\*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**ADVANCED AUGMENTOR-WING RESEARCH**

Thomas N. Aiken *In its* STOL Technol. 1972 p 87-96 refs

CSCL 01A

Results of research on advanced augmentors are discussed. Research concerned with performance has indicated that: (1) augmentors with lobe-type nozzles give higher thrust augmentation than those with slot-type primary nozzles, (2) the thrust of augmentor wings at forward speed is greater than that of internally blown flaps for the speed range of interest, and (3) the optimum augmentor geometry at forward speed may be different from the optimum static geometry. Analysis of augmentor-wing data has shown that the data may be correlated by accounting for the augmentation and entrainment in defining a net thrust coefficient. Author

**AERODYNAMIC LOADS MEASUREMENTS ON EXTERNALLY BLOWN FLAP STOL MODELS**

George C. Greene and Boyd Perry, III *In its* STOL Technol. 1972 p 121-130

CSCL 01A

Small-scale-model data have shown large static loads on the flap system behind the engines. The large-scale-model tests confirmed the magnitude of these loads and indicated that the relative loading of each flap element depends on the engine-wing-flap geometry. Flap response measurements indicated that the unsteady pressure loading excited the natural vibration modes

of the flap system on this model. Since this was a boilerplate model, the only conclusion that can be drawn is that the possibility of large vibration loads must be considered for a flight-weight structure. The similarity of the unsteady pressure and flap response spectra for the wind-off and wind-on cases indicated that it may be possible to realistically test flight-weight flap structures on a static test stand rather than endure the extra costs and scheduling problems associated with large-scale wind-tunnel tests. There is a potential flap-temperature problem which if not resolved might preclude the use of materials such as aluminum and the composites in the flap structure. Author

**SURVEY OF WING AND FLAP LOWER-SURFACE TEMPERATURES AND PRESSURES DURING FULL-SCALE GROUND TESTS OF AN EXTERNALLY BLOWN FLAP SYSTEM**

Donald L. Hughes *In its* STOL Technol. 1972 p 143-156 refs

CSCL 01A

Full-scale ground tests of an externally blown flap system were made using the wing of an F-111B airplane and a CF700 engine. Pressure and temperature distributions were determined on the undersurface of the wing, vane, and flap for two engine exhaust nozzles (conical and daisy) at several engine power and engine/wing positions. The tests were made with no airflow over the wing. The leading-edge wing sweep angle was fixed at 26 deg, the angle of incidence between the engine and the wing was fixed at 3 deg, and the tests were conducted with the flap retracted, extended and deflected 35 deg, and extended and deflected 60 deg. The integrated local pressures on the undersurface of the flap produced loads approximately three times as great at the 60 deg flap position as at the 35 deg flap position. With both nozzle configurations, more than 90 percent of the integrated pressure loads were contained within plus or minus 20 percent of the flap span centered around the engine exhaust centerline. The maximum temperature recorded on the flaps was 218 C (424 F) for the conical nozzle and 180 C (356 F) for the daisy nozzle. Author

**SIMULATOR EVALUATION OF THE FLYING QUALITIES OF EXTERNALLY BLOWN FLAP AND AUGMENTOR WING TRANSPORT CONFIGURATIONS**

David A. Kier, Bruce G. Powers, William D. Grantham, and Luat T. Nguyen *In its* STOL Technol. 1972 p 157-800 refs

CSCL 01A

Concurrent simulations of powered-lift STOL transport aircraft having either an externally blown flap configuration or an

augmentor wing configuration were conducted. The following types of simulators of varying sophistication were used: (1) a simple fixed-base simulation with a simple visual display, (2) a more complex fixed-base simulation using a realistic transport cockpit and a high-quality visual display, and (3) a six-degree-of-freedom motion simulator that had a realistic transport cockpit and a sophisticated visual display. The unaugmented flying qualities determined from these simulations were rated as unacceptable for both the externally blown flap and augmentor wing configurations. The longitudinal, lateral-directional, and single-engine-failure characteristics were rated satisfactory with extensive augmentation, including pitch and roll command systems, flight-path (or speed) augmentation, turn coordination, and effective yaw damping. However, the flare and landing characteristics from any approach glide-path angle in excess of 4 deg were rated as unsatisfactory but acceptable. Author

**FLIGHT-PATH AND AIRSPEED CONTROL FOR THE STOL APPROACH AND LANDING**

James A. Franklin and Robert C. Innis *In its STOL Technol.* 1972 p 181-198 refs

CSCL 01C

Analytical investigations and piloted moving base simulator evaluations were conducted for manual control of flight path and airspeed for the approach and landing of a powered lift jet STOL aircraft. Flight-path and airspeed response characteristics were described analytically and were evaluated for the simulation experiments which were carried out on a large motion simulator. The response characteristics were selected and evaluated for a specified path and speed control technique. These characteristics were the initial flight-path response, flight-path overshoot, flight-path-airspeed coupling in response to a change in thrust, and the sensitivity of airspeed to pitch-attitude changes. Results are presented in the form of pilot opinion ratings and commentary, substantiated where appropriate by response time histories and aircraft states at the point of touchdown. Author

**A FLIGHT EVALUATION OF CURVED LANDING APPROACHES**

S. W. Gee, M. R. Barber, and T. C. McMurtry *In its STOL Technol.* 1972 p 245-258 refs

CSCL 01C

The development of STOL technology for application to operational short-haul aircraft is accompanied by the requirement for solving problems in many areas. One of the most obvious problems is STOL aircraft operations in the terminal area. The increased number of terminal operations needed for an economically viable STOL system as compared with the current CTOL system and the incompatibility of STOL and CTOL aircraft speeds are positive indicators of an imminent problem. The high cost of aircraft operations, noise pollution, and poor short-haul service are areas that need improvement. A potential solution to some of the operational problems lies in the capability of making curved landing approaches under both visual and instrument flight conditions. Author

**PRELIMINARY RESULTS OF FLIGHT TESTS OF THE AUGMENTOR-WING JET STOL RESEARCH AIRCRAFT**

Hervey C. Quigley and Richard F. Vomaske *In its STOL Technol.* 1972 p 259-282 refs

CSCL 01C

The Augmentor-Wing Jet STOL Research Aircraft has been developed and has started flight tests. The objectives of the program are to compare aerodynamic characteristics predicted from wind-tunnel data with data obtained in flight, to determine flight dynamic characteristics and limitations of the augmentor-

wing concepts, and to contribute to the development of STOL design and operational criteria. Initial flight test results have shown that the aerodynamic characteristics are close to values predicted from wind-tunnel tests. The lateral-directional stability and control characteristics are satisfactory for research STOL missions with stability augmentation, but the longitudinal control require improvement. STOL take-off distance over 11 m is about 290 m, and landing approach speeds are between 60 and 65 knots. The investigation of the STOL operational and performance characteristics is continuing. Author

**FOUR-D GUIDANCE OF STOL AIRCRAFT IN THE TERMINAL AREA**

Thomas Pecsvaradi and Heinz Erzberger *In its STOL Technol.* 1972 p 307-332 refs  
CSCL 17G

The primary objective of advanced STOL aircraft is the improvement of the nation's air transportation system by the elimination of delays and congestions associated with today's air travel. A new guidance technique, referred to as 4-D guidance, is being developed to achieve this objective. The 4-D guidance technique synthesizes complex three-dimensional flight

paths from a minimum set of input data and flies the aircraft along the paths according to a prespecified time schedule. The two major elements of a 4-D guidance system are the trajectory synthesizer and the control law. Inputs to the trajectory synthesizer are the three-dimensional coordinates of way points, the turning radii, the speed ranges, the acceleration limits, and the arrival times at time control way points. First, the three-dimensional trajectory is computed by using circular arcs and straight lines. Then the airspeed profile, compensated for wind, is calculated to achieve the desired arrival times. The synthesized trajectory is stored as a time sequence of reference states which the aircraft is forced to track by using a linear feedback law. Author

**TERMINAL-AREA STOL OPERATING SYSTEMS EXPERIMENTS PROGRAM**

Donald W. Smith, DeLamar Watson, and Jay V. Christensen *In its STOL Technol.* 1972 p 333-343 ref

CSCL 01E

A system study to determine the application of short takeoff aircraft for a high speed, short haul air transportation service was conducted. The study focused on developing information which will aid in choosing system concepts, design criteria, operating procedures, landing guidance systems, air traffic control systems, and airborne avionics and flight control systems. A terminal area STOL operating system experiments program was developed. The objectives, program approach, program schedule, typical experiments, research facilities to be used, and program status are discussed. Author

**PROGRAM PLAN TO DEVELOP AIRWORTHINESS STANDARDS FOR STOL AIRCRAFT**

Jack E. Cayot (FAA), Robert A. Chubboy (FAA), and Charles S. Hynes *In its STOL Technol.* 1972 p 345-351 refs

CSCL 01C

A program plan to develop criteria for airworthiness standards for STOL transport aircraft is presented. Initially, three different STOL concepts are to be examined with a goal to arrive at a generalized set of standards. The Breguet 941 deflected-slipstream STOL has been initially evaluated on a piloted motion simulator and in flight. Confidence in establishing criteria for airworthiness standards for STOL transport aircraft has been obtained from these studies. Author

**QUIET STOL PROPULSION SESSION INTRODUCTORY REMARKS**

Robert W. Schroeder *In its STOL Technol.* 1972 p 367-370

CSCL 20A

Research activities, preliminary design activities, and system optimization studies in support of the development of advanced, quiet, STOL propulsion systems are discussed. Noise alleviation by means of controlling the source and by means of acoustical treatment receive considerable emphasis. A STOL airplane designed for a given payload has essentially double the installed thrust of a comparable CTOL airplane. Unless compensated for during the design process, this alone will tend to increase the source noise by 3 db. The propulsive lift introduces flap impingement noise or duct and flap scrubbing noise, noise sources not present in CTOL airplanes to any significant degree. These

additional noise sources are illustrated. Depending on the specific configuration, this will tend to increase the noise by several db or more. Although the propulsive lift characteristics of STOL airplanes will tend to increase source noise significantly, the proximity of STOL airfields to populated areas leads to STOL noise objectives considerably lower than those currently applicable to CTOL airplanes. #### ENGINE NOISE TECHNOLOGY

Roger W. Luidens, Donald R. Dietrich, James H. Dittmar, Richard G. Goldman, William A. Olsen, Jr., and Brent A. Miller *In its* STOL Technol. 1972 p 371-412 refs

#### CSCS 21A

The characteristics of aircraft engine noise are discussed. Data are provided to show the noise produced by the following aircraft components: (1) fan noise, (2) noise suppressing structures, (3) sonic inlets, (4) jet mixing noise due to nozzle flow, and (5) thrust reversers. Charts are developed to show the sound pressure level and the frequencies for each type of noise source. The use of laminates and composite materials to dissipate acoustic power is examined. Author

#### FLAP NOISE GENERATION AND CONTROL

David Chestnutt, Domenic J. Maglieri, and Richard E. Hayden (Bolt, Beranek and Newman, Inc.) *In its* STOL Technol. 1972 p 413-426 refs

#### CSCS 01A

The characteristics of aerodynamic noise generated by the interaction of an airstream with a flap surface are discussed. The location and behavior of various noise sources were investigated to determine optimal quieting techniques. A schematic diagram of the jet-flap concepts being considered for integrated-powered-lift systems for short takeoff aircraft is shown. Each of the concepts has in common high velocity turbulent air flowing over relatively rigid surfaces with resultant production of interaction noise. The nature, location, and control of noise sources which involve the interactions of air flows with airfoil surfaces are examined. Author

#### EXTERNALLY BLOWN FLAP IMPINGEMENT NOISE

Paul L. Lasagna and Terrill W. Putnam *In its* STOL Technol. 1972 p 427-441 refs

#### CSCS 20A

Tests of the noise produced by the impingement of the jet exhaust on the wing and flap for an externally blown flap system were conducted with a CF700 turbofan engine and an F-111B wing panel. The noise produced with a daisy nozzle installed on the engine was greater than that produced by a conical nozzle at the same thrust. The presence of the wing next to the test nozzles increased the noise, as did increasing the flap deflection angle. Compared with the conical nozzle, the daisy nozzle produced slightly less noise at a flap deflection of 60 deg but produced more noise at the lower flap deflections tested. Tests showed that the single-slotted flap deflected 60 deg, produced less noise than the double-slotted flaps. Also, maintaining the maximum distance between the exit nozzle and flap system resulted in a minor reduction in noise. Author

#### ACOUSTIC CHARACTERISTICS OF LARGE-SCALE STOL

#### MODELS AT FORWARD SPEED

Michael D. Falarski (Army Air Mobility Res. and Develop. Lab.), Kiyoshi Aoyagi, and David G. Koenig *In its* STOL Technol. 1972 p 443-454 refs

#### CSCS 20A

Wind-tunnel investigations of the acoustic characteristics of the externally blown jet flap (EBF) and augmentor wing STOL concepts are discussed. The large-scale EBF model was equipped with a triple-slotted flap blown by four JT15D turbofan engines with circular, coannular exhaust nozzles. The large-scale augmentor wing model was equipped with an unlined augmentor blown by a slot primary nozzle. The effects of airspeed and angle of attack on the acoustics of the EBF were small. Flap deflection had a greater effect on the acoustics of the augmentor wing than did airspeed. The total sound power was also significantly higher for landing indicating that turning in the augmentor generated acoustic energy. Airspeed produced a small aft shift in acoustic directivity with no significant change in the peak perceived noise levels or sound power levels. Small-scale research of the acoustics for the augmentor wing has shown that by blowing an acoustically treated augmentor with a lobed primary nozzle, the 95-PNdB noise level goal can be achieved or surpassed. #### EBF NOISE TESTS WITH ENGINE UNDER-THE-WING AND OVER-THE-WING CONFIGURATIONS

Robert G. Dorsch and Meyer Reshotko *In its* STOL Technol. 1972 p 455-473

#### CSCS 20A

Noise tests of externally blown flaps with the engine under the wing and engine over the wing configurations were conducted. Flap noise data obtained on a TF-34 aircraft are discussed. Noise data obtained during a free-jet forward-speed-effect analysis are presented. Noise sources associated with upper surface flap blowing are described. Results of a small scale configuration screening study and some large scale model test data are analyzed. The noise data for the engine over wing configurations are compared with the engine under the wing configurations. Author

#### STOL PROPULSION SYSTEMS

Robert J. Denington, Robert W. Koenig, Michael R. Vanco, and David A. Sagerser *In its* STOL Technol. 1972 p 475-509 ref

#### CSCS 21A

The selection and the characteristics of quiet, clean propulsion systems for STOL aircraft are discussed. Engines are evaluated for augmentor wing and externally blown flap STOL aircraft with the engines located both under and over the wings. Some supporting test data are presented. Optimum engines are selected based on achieving the performance, economic, acoustic, and pollution goals presently being considered for future STOL aircraft. The data and results presented were obtained from a number of contracted studies and some supporting NASA inhouse programs, most of which began in early 1972. The contracts include: (1) two aircraft and mission studies, (2) two propulsion system studies, (3) the experimental and analytic work on the augmentor wing, and (4) the experimental programs on Q-Fan. Engines are selected and discussed based on aircraft economics using the direct operating cost as the primary criterion. This cost includes the cost of the crew, fuel, aircraft, and engine maintenance and depreciation. Author

**FORWARD VELOCITY EFFECTS ON JET NOISE WITH DOMINANT INTERNAL NOISE SOURCE**

U. VonGlahn and J. Goodykoontz 1973 17 p refs Presented at 86th Meeting of Acoustical Soc. of Am., Los Angeles, 30 Oct. - 2 Nov. 1973  
(NASA-TM-X-71438; E-7694) Avail: NTIS HC \$3.00 CSCL 20A

Acoustic data, with and without forward velocity, were obtained with a circular nozzle using a quiet flow system and one dominated by a low frequency internal noise source (analogous to combustion noise). Forward velocity effects were obtained by installing the test nozzle in a free jet. Farfield noise data were obtained, at jet pressure ratios from 1.3 to 1.7 and forward velocities up to 260 ft/sec. With a quiet flow system, jet noise is reduced by forward velocity. With a dominant low frequency core noise source, the portion of the noise spectra dominated by this source was not appreciably affected by forward velocity.

**FLAP NOISE PREDICTION METHOD FOR A POWERED LIFT SYSTEM**

B. Clark, R. Dorsch, and M. Reshotko 1973 15 p refs Presented at the Aero-Acoustic Specialists Conf., Seattle, 15-17 Oct. 1973; sponsored by AIAA

(NASA-TM-X-71449; E-7717) Avail: NTIS HC \$3.00 CSCL 20A

A method is presented for estimating the noise generated by deflection of the engine exhaust for under-the-wing and over-the-wing versions of an externally blown flap configuration for powered lift. Correlation equations and curves are given for the overall sound pressure level and directivity and for spectra scaled to a high bypass 25,000-pound thrust size engine. Data are taken from TF34 engine tests and from large cold flow model tests. The correlations are empirical, and thus application of this prediction procedure is limited to geometrically similar configurations. Application of the method is illustrated by calculated sample footprints.

**A FLIGHT STUDY OF THE USE OF DIRECT-LIFT-CONTROL FLAPS TO IMPROVE STATION KEEPING DURING IN-FLIGHT REFUELING**

Walter E. McNeill, Ronald M. Gerdes, Robert C. Innis, and Jack D. Ratcliff Washington Oct. 1973 30 p refs

(NASA-TM-X-2936; A-4904) Avail: NTIS HC \$3.00 CSCL 01C

To investigate the effectiveness of fast-acting flaps as direct-lift-control (DLC) devices on a fighter airplane, the aileron servo systems of an F-100C variable-stability airplane were modified to provide symmetrical actuation of the surfaces. Initial flight tests using DLC indicated that the task of formation flying and, hence, in-flight refueling could be eased by actuating the DLC flaps through the conventional control stick, with the degree of improvement depending on the basic stability of the receiver aircraft. Results of refueling approaches and connections with U.S. Air Force tankers indicated a moderate overall improvement in vertical station-keeping performance (approximately 19 percent) and a sizeable overall decrease in receiver airplane motions and control activity (approximately 40 percent) with DLC.

(FAA-RD-72-40-Vol-3; D6-60196-Vol-3) Avail: NTIS HC \$13.75

Modifications performed on a Boeing 727 aircraft to obtain reduced aerodynamic noise are discussed. Level flyovers covering a wide range of thrusts and altitudes were recorded with a widely spaced microphone grid for the study of long range noise propagation. Acoustic, propulsion, and aerodynamic performance analyses were made, along with the physical effects of integrating the modifications on the aircraft. A direct operating cost analysis was prepared based on realistic retrofit installation cost estimates and aircraft performance analyses.

**WIND TUNNEL INVESTIGATION OF A LARGE-SCALE UPPER SURFACE BLOWN-FLAP TRANSPORT MODEL HAVING TWO ENGINES**

Kiyoshi Aoyagi, Michael D. Falarski, and David G. Koenig Aug. 1973 69 p refs Prepared in cooperation with Army Air Mobility R and D Lab., Moffett Field, Calif.

(NASA-TM-X-62296) Avail: NTIS HC \$5.50 CSCL 01C

An investigation has been conducted to determine the aerodynamic characteristics of a large-scale subsonic jet transport model with an upper surface blowing flap system that would augment lift. The model had a 25 deg swept wing of aspect ratio 7.89 and two turbofan engines with the engine centerline located at 0.256 of the wing semispan. The lift of the flap system was augmented by turbofan exhaust impingement on the Coanda surface. Results were obtained for several flap deflections and engine nozzle configurations at jet momentum coefficients from 0 to 4.0. Three-component longitudinal data are presented with two engines operating. Limited longitudinal and lateral data are presented with an engine out. In addition, limited exhaust and flap pressure data are presented.

**WIND TUNNEL TESTS OF AN F-8 AIRPLANE MODEL EQUIPPED WITH AN OBLIQUE WING**

Lawrence A. Graham, Robert T. Jones, and James L. Summers Jun. 1973 72 p refs

(NASA-TM-X-62273) Avail: NTIS HC \$5.75 CSCL 01C

An experimental investigation was conducted in an 11- by 11-foot transonic wind tunnel to study the lift, drag and stability characteristics of a 0.087-scale model of an operational airplane fitted with an oblique wing. The model wing was of elliptical planform with an unswept aspect ratio of 12.7 and a thickness of 10 percent. All other external geometric features of the model were scaled to the basic full size operational airplane with the engine inlet faired closed. Longitudinal and lateral-directional stability data were obtained with the wing at sweep angles of 0 deg, 45 deg and 60 deg Test Mach numbers ranged from

0.6 to 1.4 deg Angles of attack were between minus 4 deg and 8 deg at zero sideslip. Angles of sideslip were between plus and minus 4 degrees for two angles of attack depending upon the wing configuration. Tests were conducted at a Reynolds number of 6 million per foot except for a few runs when balance capacity limited the Reynolds number to 4 million per foot.

**THEORETICAL STUDY OF LIFT GENERATED VORTEX SHEETS DESIGNED TO AVOID ROLL UP**

Vernon J. Rossow Sep. 1973 39 p refs

(NASA-TM-X-62304) Avail: NTIS HC \$4.00 CSCL 01A

The random motions of the vortex elements behind a wing that sheds a disturbed, translating array of vortices are analyzed. The analysis indicates that the wake would diffuse and decay rapidly when viscosity is present and would produce small rolling moments on encountering aircraft. It was found that comparable results could also be achieved with an array consisting of vortices that are equal in magnitude but which alternate in sign. This observation indicates that random motion can probably be achieved with a variety of stepped loadings.

**NONLINEAR CONTROL CONCEPTS FOR VARIABLE STABILITY AIRCRAFT [NICHTLINEARE REGLERKONZEPTE FUEER FLUGZEUGE VARIABLER STABILITAET]**

G. Gruebel (Bochum Univ., West Ger.) In DGLR Flight Control Systems: Requirements and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 7-16 In GERMAN

Based on a unified point of view, the basically possible feedback control concepts for aircraft with variable stability are derived and discussed. Treatment is limited to the general nonlinear case; the treatment of a linearized state for stationary flight results as a special case. It is shown that as the basis of the general nonlinear equations of motion of a reference aircraft and a model, the possible control structures can be simply derived, in which process the related control laws are determined by nonlinear equation systems.

**DESIGN OF A MODERN FIGHTER AIRCRAFT CONTROL SYSTEM USING QUADRATIC COST FUNCTIONS [AUSLEGUNG EINES REGELSYSTEMS FUEER MODERNE KAMPFFLUGZEUGE MIT HILFE QUADRATISCHER KOSTENFUNKTIONEN]**

G. Schaezner and R. Stadler In DGLR Flight Control Systems: Requirements and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 17-36 refs In GERMAN

The optimization of a control and damping system for fighter aircraft is discussed. Essential specifications, such as gust and flight control behavior, and stability, can be described exactly by a single quadratic integral quality criterium (cost function). It is shown that the controller, optimized for minimal costs, gives an especially favorable performance related to flight control, disturbance, stability and parameter sensitivity. The investigation of parameter sensitivity produced indications for technical simplification of the control system structure.

**DESIGN OPTIMIZATION AND TESTING OF FLIGHT CONTROL SYSTEMS FOR LIGHT HELICOPTERS [OPTIMALE AUSLEGUNG UND ERPROBUNG VON FLUGREGELUNGSSYSTEMEN FUER LEICHTE HUBSCHRAUBER]**

Herbert Koenig /in DGLR Flight Control Systems: Requirements and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 145-170 refs In GERMAN

Based on the flight dynamic properties of the BO-1-5 helicopter with hingeless rotor, characterized by very good controllability, the influence over several controller concepts was investigated. Flight control systems consisting of a fast controller (with authority limitation of the regulating distance) as attitude stabilizers, and a slow controller as automatic trimmers (with limitation of the regulating speed), were found to be the optimal controller concepts for this type of helicopter. A further optimal concept results from addition of an altitude control, which includes the trimmer system. The investigations and tests have shown that, with relatively little effort, pilot activity can be considerably simplified. ESRO

**N73-32986** Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (West Germany).

**EFFECT OF ARTIFICIAL STABILITY ON AIRCRAFT PERFORMANCES [EINFLUSS DER KUENSTLICHEN STABILITAET AUF DIE FLUGLEISTUNGEN]**

D. Reich /in DGLR Flight Control Systems: Requirements and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 171-186 In GERMAN

Based on the control configured vehicle (CCV) concept, i.e. taking account of the flight control during the design phase, the effect of an artificial longitudinal stability on the performance of aircraft was investigated. In consequent application of the CCV concept, in the most favorable cases a decrease of about 15% in takeoff weight (for the same radius of action) or an increase of 11% in radius of action (for the same takeoff weight) can be achieved. For a fighter aircraft, it is shown that the advantages of an artificial longitudinal stability are obtained for high lift coefficients and for plane wing-body drag polars. ESRO

**N73-32987** Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (West Germany).

**FLIGHT MECHANICAL AND CONTROL TECHNICAL CONSIDERATIONS OF ARTIFICIAL STABILITY AIRCRAFT [FLUGMECHANISCHE UND REGELUNGSTECHNISCHE GESICHTSPUNKTE FUER FLUGZEUGE KUENSTLICHER STABILITAET]**

G. K. Kissel /in DGLR Flight Control Systems: Requirements

and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 187-196 In GERMAN

The effects of artificial aircraft stability control on the damping behavior, and the recovery of static stability by means of controllers, are discussed. In designing aircraft the rule that static stability should be available to obtain airworthiness is of major importance. If this rule is not maintained, a reduction of the induced trimming resistance and an increased maneuverability performance can be gained. Airworthiness should then be regained artificially using flight controllers. The improvements obtained in damping behavior are described, and the possibilities of regaining static stability are surveyed. ESRO

**N73-32988** Bodenseewerk Geraetetechnik G.m.b.H., Ueberlingen (West Germany).

**BASIC TECHNICAL DESIGN OF THE CONTROL SYSTEM FOR AN ARTIFICIAL STABILITY AIRCRAFT [GRUNDSATZLICHER TECHNISCHER ENTWURF DES STEUERUNGSSYSTEMS FUER EIN FLUGZEUG MIT KUENSTLICHER STABILITAET]**

L. Goumas / In DGLR Flight Control Systems: Requirements and Design Probl. from the Flight Mech. Viewpoint Mar. 1972 p 197-209 In GERMAN

The fundamental design of a pitching axis control system for aircraft with artificial stability is discussed. This control system is based on the measurement of the angular deviation with an air current directional sensor. In order to prevent sensor failures and for consolidation of signals with disparities, the outputs of the air current directional sensor are blocked with supervisory circuits. The produced feedback signal was compared with the control branch signal, and the difference signal passed on to the pitch controller. A hydraulic actuator on the horizontal tail surface closes the feedback circuit. ESRO

**[AIRSHIPS: PAST, PRESENT, AND FUTURE] [BERICHT UEBER DAS LUFTSCHIFF-KOLLOQUIUM DER DGLR]**

Aug. 1972 172 p refs In GERMAN; ENGLISH summary Proc. of the DGLR Airship Colloq., Stuttgart, 6 Apr. 1972 (DLR-MITT-72-17) Avail: NTIS HC \$10.75; ZLDI; Munich 36.15 DM

The technical and economic aspects of using airships for air transportation are discussed. The history of Zeppelin airships is presented. The cost effectiveness of airship passenger and freight transportation is analyzed. Details of the manufacture of flexible airships are presented and ground and loading operations surveyed. The aerodynamic drag and lift of airships is determined; and drag reduction possibilities discussed. The technical conditions for further airship development, based on present technology, are summarized.

**THE ZEPPELIN AIRSHIP, INITIATOR OF WORLD AIR TRAFFIC [ZEPPELIN, WEGBEREITER DES WELTLUFTVERKEHRS]**

Hans VonSchiller / In *its* Airships, Past, Present, and Future Aug. 1972 p 11-25 In GERMAN

The history of Zeppelin airships is presented. The first Zeppelin dirigible flew for 18 minutes on July 1, 1900. The airship was used for civil and military aviation, the latter particularly during World War I. After World War I, the Zeppelin was introduced in the United States, and an Atlantic Ocean crossing was made in 1929. Civil flights to South America were interrupted after the catastrophe of the Hindenburg during the landing of the

Graf Zeppelin in Friedrichshafen on 8 May 1937, as a result of which hydrogen gas filling was replaced by nonflammable helium. ESRO

**POSSIBILITIES OF AND PROSPECTS FOR PASSENGER AND FREIGHT TRANSPORT BY AIRSHIPS [MOEGLICHKEITEN UND AUSSICHTEN EINES PERSONEN- UND GUTETRANSPORTS MIT LUFTSCHIFFEN]**

Eckart Krueger / In DGLR Airships: Past, Present, and Future Aug. 1972 p 27-39 In GERMAN

The possibilities and perspectives of using airships for air transportation of passengers and cargo are discussed. Three conditions for successful realization of this concept are: (1) technical realization should be possible, (2) the level of costs involved in construction, manufacturing, and management should allow a selling price leading to a corresponding sales success, and (3) the new product should fit in to the broad spectrum of present offers, and have certain advantages. An important aspect is environment pollution, to which these airships will contribute little. Long-distance flights are seen as the best use because of the airship's hotel-like character. ESRO

**EXPERIMENTAL PROGRAM FOR THE DEVELOPMENT OF IMPROVED HELICOPTER STRUCTURAL CRASHWORTHINESS ANALYTICAL AND DESIGN TECHNIQUES. VOLUME 1: COMPUTERIZED UNSYMMETRICAL MATHEMATICAL SIMULATION AND EXPERIMENTAL VERIFICATION FOR HELICOPTER CRASHWORTHINESS IN WHICH MULTIDIRECTIONAL IMPACT FORCES ARE PRESENT** Final Technical Report

Gilbert Wittlin and Max A. Gamon May 1973 224 p refs (Contract DAAJ02-71-C-0066; DA Proj. 1F1-62203-A-529) (AD-764985; USAAMRDL-TR-72-72A-Vol-1) Avail: NTIS CSDL 01/2

The results of a four-phase study to develop helicopter structural crashworthiness analytical and design techniques are presented. The study consisted of the development of a computer program (KRASH) and the verification of a mathematical model to predict the dynamic response during a survivable accident in which combined vertical and lateral impact velocities are present. Included in the study were a literature survey and evaluation, a detailed analysis of 32 accident cases, a drop test of a UH-1H helicopter with ground impact conditions of 23 fps vertical velocity and 18.6 fps lateral velocity, and parameter studies. It is concluded that program KRASH is capable of accurately predicting the dynamic responses during a multi-directional accident and that the program is a valuable tool with which to perform design tradeoff studies. **ELECTRONIC DISPLAYS IN AIRCRAFT PILOTING [ELEKTRONISCHE DISPLAYS IN DER FLUGFUEHRUNG]**

Jul. 1972 42 p refs In GERMAN; ENGLISH summary Presented at the 12th DGLR Comm. Meeting on Human Factors Engineering, Meckenheim, West Ger., 5 Nov. 1971 (DLR-MITT-72-04) Avail: NTIS HC \$4.25; ZLDI, Munich 8.65 DM

Two problems are described in the application of electronic display systems to aircraft. The first problem is that of reinforcing the pilot's activity during fully automatic landings; this can be solved by four tasks for advanced displays, whether used for manual control or as a monitor device in automatic landings. The second is the use of predictive displays for manual path and position control of VTOL aircraft. Two displays are discussed and have been tested: an overground display for path control, and an artificial horizon for position control.

**USE OF PREDICTIVE DISPLAYS IN THE MANUAL PATH AND POSITION CONTROL OF VTOL AIRCRAFT [DER EINSATZ VON VORANZEIGEN BEI DER MANUELLEN KURS- UND LAGEREGLUNG VON VTOL-FLUGZEUGEN]**

G. Johannsen In *DGLR Electron. Displays in Aircraft Piloting* Jul. 1972 p 23-33 refs In GERMAN

The role of prediction displays for manual control of VTOL aircraft is discussed. The systems investigated are based on the extrapolative method of prediction, and two-parameter control. Two displays are discussed: an overground display for path control, and an artificial horizon for position control both for a simulated VTOL aircraft. A number of tests were carried out to determine the effectiveness of these prediction displays. Results of the overground display show that because of the control task difficulty, the learning phase should last a few days. In the case of the artificial horizon, a clear reduction of the control errors is found by using the predictive display. ESRO

**N73-33157#** School of Aerospace Medicine, Brooks AFB, Tex. **A CRITICAL ASSESSMENT OF GROUND-BASED DEVICES FOR SPATIAL ORIENTATION TRAINING** Preliminary Report.

Sep. 1972 - Apr. 1973

Patrick J. Dowd Aug. 1973 18 p refs (AF Proj. 7930)

(AD-764740; SAM-TR-73-23) Avail: NTIS CSDL 05/9

Comparisons are made of selected orientation training devices in relation to U.S. Air Force flight training in the T-38 airplane. Assessment categories are: motion parameters, illusions that each device can generate, type of instrumentation available to the pilot-subject in relation to attitude and control, reaction capability provided in each device for the subject to recover or correct his attitude, capability to measure and evaluate the subject's performance in coping with disorienting maneuvers, invulnerability to weather, safety, and initial and operating costs. The USAFSAM spatial orientation trainer (SOT) far excels all other ground-based devices for both hardware- and pilot-oriented assessment criteria. The use and need of a SOT-type trainer are discussed. Author (GRA)

**THE FLUID MECHANICS OF THE HOLE TONE** Ph.D. Thesis

Ram Kumar Matta 1973 171 p

Avail: Univ. Microfilms Order No. 73-18133

The hole tone is a whistle which has been empirically developed as an efficient producer of discrete frequency sound. Two parallel plates with an orifice in each are situated a short distance apart. The jet formed by fluid flow through one orifice impinges centrally on the second orifice and, under certain conditions, gives rise to a pure tone. The sound is aerodynamically generated. The mechanism involves symmetric disturbances of the jet and vortex ring formation in the vortex sheet surrounding the free jet. A model is postulated to show how the energy of a free jet is converted into acoustically radiated energy. According to the model, a periodic disturbance is imposed on

the jet at exit from the upstream orifice, resulting in the formation of a vortex ring street. The rings propagate downstream and interact with the second orifice-plate giving rise to a periodic flow through the orifice. This unsteady flow is the source of sound and also provides the perturbation at the upstream orifice which triggers the instability of the jet. The analytic model is found to correctly predict the qualitative characteristics of the hole tone and quantitative characteristics such as the tone frequency and pressure amplitude. Dissert. Abstr.

**EXPERIMENTS ON THE NEARLY ISOTROPIC TURBULENCE BEHIND A JET GRID** Ph.D. Thesis

Mohamed Abo-El-Fath Mohamed Gad-El-Hak 1973 231 p  
 Avail: Univ. Microfilms Order No. 73-16642

Wind tunnel turbulence behind a parallel rod grid with jets evenly distributed along each rod is nearly isotropic. Homogeneity improvement over prior related experiments was attained by the use of controllable nozzles. Compared with the passive case, the downwind-jet active grid gives smaller static pressure drop across it and smaller turbulence level at a prescribed distance from it, while the upwind-jet grid gives larger static pressure drop and larger turbulence level. Counterflow injection apparently increases the effective solidity, causing instability, larger turbulent energy and larger scales. If the inverse turbulent kinetic energy is approximated as a power law of distance, the exponent decreases with increasing downwind or upwind jet strength, corresponding to slower decay rates. No peculiar decay behavior occurs when the grid is self-propelled (net average force on it = 0), or when the static pressure drop across it is zero. The injection does not change the general behavior of the energy spectra although the absolute spectra changes in as much as the turbulence kinetic energy changes. Dissert. Abstr.

**ASSESSMENT OF JETS AS ACOUSTIC SHIELDS BY COMPARISON OF SINGLE- AND MULTITUBE SUPPRESSOR NOZZLE DATA**

Vernon H. Gray, Orlando A. Gutierrez, and David Q. Walker 1973 21 p refs Presented at the Aeroacoustic Specialists Conf., Seattle, 15-17 Oct. 1973; sponsored by AIAA (NASA-TM-X-71450; E-7690) Avail: NTIS HC \$3.25 CSCL 20D

Recent 1/4 scale and engine size nozzle acoustic data, for both 37-tube and single nozzles, were used to test the jet-shielding principle. At low jet velocities the multitube nozzle total sound power approaches the equivalent of 37 single tubes (no shielding), while near-sonic and above, the small equivalent number of single tubes compares well with a geometric model of lateral radiation from only about a third of the circumference of the outer jets (nearly complete shielding). At high jet velocities, the geometric shielding hypothesis is in excellent agreement with acoustic data from which the downstream coalesced jet noise is excluded. Present results are compared with an existing correlation for single jets, and with previous publications on multijet shielding.

**ON THE RELATIONSHIP BETWEEN ACOUSTIC ENERGY DENSITY FLUX NEAR THE JET AXIS AND FAR FIELD ACOUSTIC INTENSITY**

Lucio Maestrello Washington Oct. 1973 64 p refs (NASA-TN-D-7269; L-8871) Avail: NTIS HC \$3.00 CSCL 20D

By measurement and analysis, the relationship between the distribution of the outflow of acoustic energy over the jet boundary

and the far-field intensity is considered. The physical quantity used is the gradient of the pressure evaluated on a geometrical plane at the smallest possible radial distance from the jet axis, but outside the vortical region, in the area where the homogeneous wave equation is reasonably well satisfied. The numerical and experimental procedures involved have been checked out by using a known source. Results indicate that the acoustic power output per unit length of the jet, in the region from which the sound emanates, peaks at approximately 9 diameters downstream. The acoustic emission for a jet Strouhal number of about 0.3 exceeds the emission for all other Strouhal numbers nearly everywhere along the measurement plane. However, the far-field peak intensity distribution obtained from the contribution of each station was found to depend on the spatial extent of the region where sound emanates from the jet, which, in turn, depends more on the far-field angle than on the Strouhal number. **CALCULATION PROCEDURES FOR POTENTIAL AND VISCOUS FLOW SOLUTIONS FOR ENGINE INLETS**

J. A. Albers and N. O. Stockman [1973] 34 p refs Proposed for presentation at 1974 Intern. Gas Turbine Conf., Zurich, 31 Mar. - 4 Apr. 1974; sponsored by ASME (NASA-TM-X-71457) Avail: NTIS HC \$3.75 CSCL 20D

The method and basic elements of computer solutions for both potential flow and viscous flow calculations for engine inlets are described. The procedure is applicable to subsonic conventional (CTOL), short-haul (STOL), and vertical takeoff (VTOL) aircraft engine nacelles operating in a compressible viscous flow. The calculated results compare well with measured surface pressure distributions for a number of model inlets. The paper discusses the uses of the program in both the design and analysis of engine inlets, with several examples given for VTOL lift fans, acoustic splitters, and for STOL engine nacelles. Several test support applications are also given. Author

L. Sherman Mar. 1973 28 p refs  
(PB-220315/6; CSIR-SR-CENG-003) Avail: NTIS HC \$3.00 CSCL 13A

Air was blown isothermally across a bank of helically wound L-type fin tubes containing 6 tube rows. Six banks, each with a different triangular tube pitch, were investigated. The generally accepted Robinson and Briggs correlation underestimated the measured friction factor by about 20%. This is attributed to insufficient recognition of the effect of fin tube dimensions in this correlation, which also underestimates the effect of pitch, at least for the tubes used in these experiments.

**AN INSTRUMENT FOR MEASURING STEADY AND OSCILLATORY AERODYNAMIC FORCES**  
L. Stellema Nov. 1973 53 p refs  
(ATN-7101) Avail: NTIS HC \$4.75

An instrument to measure the steady and oscillatory aerodynamic forces on a sting-mounted model, using the forced oscillatory technique is described. The sting is oscillated in a sinusoidal motion of known amplitude and frequency. A flexible reference beam, situated outside the wind tunnel is oscillated in phase with the sting. A strain-gauge bridge bonded to the reference beam provides a phase reference signal. With the wind off, the amplified output of the strain-gauge bridge, on the reference

beam, is made equal to the amplified output of the two strain-gauges bridges on the sting, by means of two attenuators. Thus the outputs from the sting amplifiers due to inertia are made zero, and when the wind is on the true oscillatory aerodynamic forces can be measured. To measure the steady state forces, the dc output of the sting due to weight is set at zero by means of a potentiometer when the wind is off. Author

**TURBULENCE NEAR THE TROPOPAUSE IN THE PRESENCE OF HIGH ALTITUDE WAVES**

G. S. Buldovskiy In its Analysis of Meteorol. Conditions for Aviation (JPRS-60114) 25 Sep. 1973 p 17-27 refs Transl. into ENGLISH from the publ. "Analiz Meteorologicheskikh Usloviy dlya Aviatsii" Leningrad, Gidrometeoizdat, 1972 p 17-27

A study was made of the distribution of the recurrence rate of cases of buffeting of different intensity in the troposphere, the layer of the tropopause and the lower stratosphere (to 18km) under the conditions of high altitude waves. It was established that for the occurrence of moderate or severe turbulence near the tropopause, in addition to the high altitude waves it is necessary also to have significant vertical shifts of the wind vector, usually observed near the maximum in the vertical profile of the wind velocity. The probability of turbulence near the tropopause is greater, the deeper the inversion in the tropopause layer. An analysis was made of the data of individual flights under the conditions of high altitude waves. Author

**ADMISSIBLE SCALE OF SPATIAL AVERAGING OF THE VALUES OF THE GEOPOTENTIAL IN THE STRATOSPHERE CONSIDERING THE EFFECT OF THE WIND ON THE FLIGHT OF A SUPERSONIC AIRCRAFT**

S. V. Solonin and G. I. Mazurov In its Analysis of Meteorol. Conditions for Aviation (JPRS-60114) 25 Sep. 1972 p 52-61 refs Transl. into ENGLISH from the publ. "Analiz Meteorologicheskikh Usloviy dlya Aviatsii" Leningrad, Gidrometeoizdat, 1972 p 52-61

A study was made of the effect of the spatial variability of the wind in the stratosphere on the accuracy of maintaining the flight trajectory of a supersonic transport (SST) at a given altitude. On the basis of simulating the flights with different supersonic velocities on the level of the 100 millibar isobaric surface, admissible scales of spatial averaging of the data on the baric field were established as a function of the significance of the air space. The accuracy of maintaining the given route under different aerodynamic conditions when using integral corrections is analyzed. The conclusion is drawn regarding the admissible scales of spatial averaging of the values of the geopotential for meteorological servicing of the SST flights. Author

**CONSTRUCTION AND VALIDATION OF DECISION-  
THEORETIC MODELS OF LOW-LEVEL PILOTING AND  
NAVIGATIONAL BEHAVIOR** Ph.D. Thesis

Don Carl Hutcherson 1973 500 p  
Avail: Univ. Microfilms Order No. 73-18907

An attempt was made to determine whether or not decision and value theory concepts can be used as elements of a model to explain the behavior of a military decision maker in the heat of battle, under severe time constraints, and in the face of the enemy. The decision task selected for analysis is that faced by a helicopter pilot in planning a route to be followed during an attack upon a target. The results indicate that considerable variation exists between subjects so that it may be impossible to develop a single route selection model that is completely acceptable to all individuals. However, the decision behavior of a predominant class of decision makers is apparently described

to an acceptable degree by the route planning model, if the threat perception model known as Model One is used to measure perceived threat. Unfortunately, the model does not describe decision behavior equally well in all route selection situations. Furthermore, the data collected so far are not sufficient to determine whether or not the model can be used to predict the type of attack a decision maker will conduct in a specific situation. **EVALUATION OF LARGE SCREEN DISPLAY IN THE AUTOMATED OCEANIC ATC ENVIRONMENT Final Report, Jan. - Jul. 1973**

Anthony J. Spingola and Robert L. Giordano Oct. 1973 45 p refs

(FAA Proj. 102-150-020)

(FAA-ND-73-75; FAA-RD-73-136) Avail: NTIS HC \$4.25

Tests were conducted utilizing a representative traffic sample within an ocean sector incorporating the northern half of the Oakland Flight Information Region (FIR). The large Screen Display (LSD) was evaluated as a subsystem of the Oceanic Air Traffic Control Experimental Automation System. All test subjects controlled the same traffic sample and performed all of the interactions appropriate to a normal ocean sector operation. The LSD was used to portray all the required oceanic ATC data. A questionnaire was completed by each test subject immediately after completion of each test. There was no intention to evaluate the automated functions as they existed in the experimental system, nor was any consideration given to the cost or technical aspects of this LSD. Analysis of controller questionnaire responses indicates generally that the LSD was an acceptable method of displaying information; however, an individual cathode ray tube was preferred. Author

**OPERATIONAL EVALUATION OF THE ARTS 2 RADAR ALPHANUMERIC DISPLAY SUBSYSTEM (RADS)**

James F. Akers and Robert A. Clark Oct. 1973 27 p

(FAA Proj. 142-175-020)

(FAA-NA-73-77; FAA-RD-73-149) Avail: NTIS HC \$3.50

A programmable, nontracking beacon Automated Radar Terminal System (ARTS II A) was installed in a TRACON configuration at the National Aviation Facilities Experimental Center. The operational suitability of the Radar Alphanumeric Display Subsystem (RADS) was evaluated. The RADS displays were evaluated over a 2-week period through the collection of subjective data obtained from controller questionnaires. It was concluded that the RADS consoles are suitable for use in air traffic control facilities. Modifications to the FOCUS control, MAP ILLUM control, A/N GAIN control, and Data Block Offset Switch are recommended. Author

**STUDY OF OCEANIC AIRSPACE AND GROUND NETWORK CONFIGURATIONS IN SATELLITE SYSTEMS Final Report**

S. A. Klein Washington FAA Jul. 1973 203 p refs

(Contract DOT-FA72WA-3102)

(FAA-RD-73-59; Rept-4183-1) Avail: NTIS HC \$12.25

The final results of a study of oceanic airspace and ground network configurations in satellite systems are presented. The purpose of the study was to investigate the restructuring of oceanic ATC airspace jurisdictional boundaries in the presence of a satellite system and to identify those future ATC jurisdictional configurations and ground facilities networks which most effectively utilize the satellite capability to obtain ground segment cost savings. The study was exploratory in nature and focused

on the 1980 time frame. The analysis was limited to specified North Atlantic and Pacific oceanic regions. The report presents detailed descriptions of the study assumptions, the cost indicator model, and the evaluation techniques, as well as a number of ancillary results regarding the technical and institutional environment of the oceanic aviation support system and the data base requirements encountered in performing the study. (AD-765153; MTR-6386; FAA-RD-73-86) Avail: NTIS CSCL 01/2

The Los Angeles Basin Standard Traffic Model is a computer model of the air traffic expected in the basin in 1982. The report explains the methodology used to project into the 1982 time frame a similar model of 1972 traffic. A technique known as time compression was used to make the projection. This report also defines the two types of models produced, the snapshot and scan-by-scan models, and it explains how the former was extracted from the later. (Modified author abstract) GRA

**AN ELECTRICAL FIELD IN THE RESERVOIR OF A FUEL TANK AS IT IS FILLED WITH ELECTRIFIED FUEL**

B. K. Maksimov, A. A. Obukh, A. A. Navatskii, and V. A. Mokryshev 27 Jul. 1973 11 p refs Transl. into ENGLISH from the book "Tekh. Vysokikh Napryazh." USSR, 1972 p 138-142

(AD-764941; FTD-HT-23-793-73) Avail: NTIS CSCL 21/4

Aviation fuel (kerosene, gasoline) is highly electrified during passage along pipes and through filters. Charged fluid, filling a reservoir, is a source of an electrical field in a vapor-air space. If the magnitude of the field reaches disruptive strength, a spark discharge will occur. The discharge can be the cause of the ignition of the fuel. The article shows the calculated and graphic dependences, which make it possible to quickly evaluate the components of a three-dimensional electrical field in a vapor-air space an example of which is the TZ-16 fuel tank. The illustrated results may be used for any other reservoir configuration which does not differ significantly from rectangular. GRA

**HIGHLY NOISE SUPPRESSED BYPASS 6 ENGINE FOR STOL APPLICATION**

W. L. Jones, L. J. Heidelberg, and R. G. Goldman 1973 21 p

refs Presented at Aeroacoustic Specialists Conf., Seattle, 15-17 Oct. 1973; sponsored by AIAA (NASA-TM-X-71448) Avail: NTIS HC \$3.25 CSCL 21E

A TF-34 engine with an acoustically treated ground test nacelle was built and tested to determine the feasibility of suppressing fan and core engine noise to the stringent levels required for STOL or short-haul commercial aircraft. The design incorporates wall treatment for the fan and core plus three treated splitter rings in the inlet and two treated splitters in the aft fan duct. Maximum suppression of fan tone noise of 40-45 db was obtained from both the inlet and aft fan treatment. At rated fan speed, overall noise was reduced by 21 PNdb to a value of 94 PNdb on a 500-foot sideline. The overall noise reduction value was limited by the jet noise floor. Thrust losses due to the acoustic treatment are also discussed. Author

**NOZZLE GEOMETRY AND FORWARD VELOCITY EFFECTS ON NOISE FOR CTOL ENGINE-OVER-THE-WING CONCEPT**

U. VonGlahn, J. Goodykoontz, and J. Wagner 1973 30 p refs Presented at 86th Meeting of the Acoustical Soc. of Am., Los Angeles, 30 Oct. - 2 Nov. 1973 (NASA-TM-X-71453; E-7730) Avail: NTIS HC \$3.50 CSCL 21E

Acoustic shielding benefits for jet noise of engine-over-the-wing for conventional aircraft (CTOL) application were studied with and without forward velocity for various small-scale nozzles. These latter included convergent, bypass and mixer, with and without forward ejector, nozzles. A 13-inch free jet was used to provide forward velocity. Farfield noise data were obtained for subsonic jet velocities from 650 to 980 ft/sec and forward velocities from zero to 360 ft/sec. The studies showed that although shielding benefits were obtained with all nozzles, the greatest benefits were obtained with mixer nozzles. The absolute magnitude of the jet noise shielding benefits with forward velocity was similar to the variation in nozzle-only noise with forward velocity. Author

**DISPERSION AND DILUTION OF JET AIRCRAFT EXHAUST AT HIGH-ALTITUDE FLIGHT CONDITIONS**

James D. Holdeman [1973] 10 p refs Proposed for presentation at the 12th Aerospace Sci. Meeting, Wash., D. C., 30 Jan. 1 Feb. 1974; sponsored by AIAA (NASA-TM-X-71451; E-7720) Avail: NTIS HC \$3.00 CSCL 21E

A method is presented for estimating the dispersion and dilution of jet aircraft exhaust from aircraft passage through times on the order of weeks thereafter. In the near wake of the aircraft, the solution is that for round turbulent jets in a parallel flow. More rapid dispersion due to atmospheric effects begins when the scale-dependent eddy viscosity becomes larger than the turbulent jet eddy viscosity. In the far wake region, the solution approaches that for scale-dependent dispersion from a point source moving with the aircraft. Calculations are presented for supersonic aircraft at high altitude flight conditions. Author

**NUMERICAL SIMULATION OF NOISE PROPAGATION IN JET ENGINE DUCTS**

Kenneth J. Baumeister and Edward C. Bittner Washington Oct. 1973 50 p refs (NASA-TN-D-7339; E-7217) Avail: NTIS HC \$3.00 CSCL 20A

A finite difference formulation is presented which is useful in the study of acoustically treated inlet and exhaust ducts used in turbofan engines. The difference formulation can readily handle acoustic flow field complications, such as axial variations in wall impedance and cross-sectional area, that would occur in a sonic inlet. In formulating the difference solutions, the continuous acoustic field is lumped into a series of grid points spread uniformly throughout the field. At each point, the pressure is separated into its real and imaginary terms. Example solutions are presented for sound propagation in a one-dimensional straight hard-wall duct and in a two-dimensional straight soft-wall duct without steady flow. Author

**A STUDY OF ENGINE VARIABLE GEOMETRY SYSTEMS FOR AN ADVANCED HIGH SUBSONIC LONG RANGE COMMERCIAL AIRCRAFT**

M. A. Compagnon Oct. 1973 112 p refs (Contract NAS3-15544) (NASA-CR-134495; R73AER185) Avail: NTIS HC \$7.75 CSCL 21E

Several variable geometry high Mach inlet concepts, aimed at meeting a system noise objective of 15 EPNdB below FAR part 36, for a long range, Mach 0.9 advanced commercial transport are assessed and compared to a fixed geometry inlet with multiple splitters. The effects of a variable exhaust nozzle (mixed exhaust engine) on noise, inlet geometry requirements, and economics are also presented. The best variable geometry inlet configuration identified is a variable cowl design which relies on a high throat Mach number for additional inlet noise suppression only at takeoff, and depends entirely on inlet wall treatment for noise suppression at approach power. Relative economic penalties as a function of noise level are also presented. Author

**BEHAVIOR OF TURBOJETS**

Jan. 1973 114 p refs In GERMAN; ENGLISH summary Proc. of the DGLR Airbreathing Propulsion Committee Meeting, Darmstadt, West Ger., 24 May 1972 (DLR-MITT-73-05) Avail: NTIS HC \$7.75; ZLDI, Munich 23.95 DM

The influence of combustion chambers, compressors, and afterburners, and their mechanical configuration, on the static performance of two-cycle turbojet engines, with a high bypass ratio was investigated. Some examples are given to show the influence of the variation of both nozzle surfaces and fuel throughput at given thrust on the parameters of the same engines without primary and secondary flow mixing. The performance of arbitrarily switched gas turbines was calculated by simulation with building block system on a digital computer. The effects of a partly oil-filled converter for a turbine engine used to supply starting power to the main engines were investigated. For individual titles, see N73-33756 through N73-33759. ESRO

**EFFECT OF SINGLE COMPONENTS AND THEIR MECHANICAL LAYOUT ON THE STATIC PERFORMANCE OF TWO-CYCLE TURBOJET ENGINES [EINFLUSS EINZELNER KOMPONENTEN UND IHRER MECHANISCHEN ANORDNUNG AUF DAS STATIONAERE BETRIEBSVERHALTEN VON 2-KREIS-TRIEBWERKEN]**

Hubert Grieb In DGLR Behavior of Turbojets Jan. 1973 p 7-50 In GERMAN

The influence of combustion chambers, compressors and afterburners, and their mechanical configuration, on the static performance of two-cycle turbojet engines with a high bypass

ratio was investigated. As a basis for comparison of the thermodynamic cycling processes, maximal thrust with and without afterburning at sea altitude and a flight Mach number of 0.9 were chosen. The following conclusions were drawn with regard to the type of engine investigated: (1) within certain limits, a desired performance can be obtained with several thermodynamic designs; (2) the influence of the mechanical configuration of the turbopart in the static performance is small; (3) the technological state-of-the-art of the components is essential for the quality of stationary operating characteristics; (4) the optimal tuning of the compressor characteristics to the expected load lines has considerable influence on the operation; (5) the design of low pressure compressor transition to medium pressure compressor and (6) bypass channel needs special attention besides mechanical conception. **PERFORMANCE BEHAVIOR OF A TWO-CYCLE TURBOJET ENGINE FOR MULTIPARAMETER CONTROL. [DAS LEISTUNGSVERHALTEN EINES ZWEISTROMTRIEBWERKS BEI MEHRGROSSENREGELUNG]**

Heinrich Dissen / In DGLR Behavior of Turbojets Jan. 1973 p 55-72 In GERMAN

Some examples are given to show the influence of the variation of both nozzle surfaces and fuel throughput at given thrust and other boundary conditions on the engine parameters of a two-cycle turbojet engine with large bypass ratio without primary and secondary flow mixing. To this end, a computation method was developed for describing the performance of engines with multiparameter control. The advantages of multiparameter control are summarized. The disadvantages are: the system is more complicated, adjustable nozzles add to the engine weight, and accurate measurements are necessary for determining the engine parameters. ESRO

(AD-765533; AFAPL-TR-73-18) Avail: NTIS CSCL 21/5

The trend in military aircraft is toward increasing thrust loading for improved maneuverability coupled with a requirement for extended subsonic cruise range at low power settings. Conventional turbine engines designed to meet these requirements must operate over large ranges of airflow between maximum power and cruise. As a result, the inlets and nozzles designed for these engines cannot perform efficiently with the low airflow rates typical of subsonic cruise operation. Variable turbine geometry, however, offers a promising approach for obtaining both high thrust loading and efficient cruise performance by permitting large amounts of thrust modulation at constant airflow rates. As an example, the performance of a turbojet engine, which provides efficient high-thrust maneuvering and supersonic operation, can be improved by variable turbine geometry to the point where it is competitive with a fixed-turbine-geometry turbofan engine in the low-thrust subsonic cruise regime. An investigation to provide the analyses, data, and hardware required to experimentally validate the beaded panel concept and demonstrate its usefulness as a basis for design of a Hypersonic Research Airplane (HRA) wing is reported. Combinations of the beaded panel structure, heat shields, channel caps and corrugated webs for ribs and spars were analyzed for the wing of a specified HRA to operate at Mach 8 with a lifespan of 150 flights. Detailed analyses were conducted in accordance with established design criteria and included aerodynamic heating and load predictions, transient structural thermal calculations, extensive NASTRAN computer modeling, and structural optimization. Optimum beaded panel tests at 922 K (1200 F) were performed to verify panel performance. Close agreement of predicted and actual critical loads permitted use of design procedures and equations for the beaded panel concept without modification. Author

To examine the effect on flutter of the aerodynamic interference between pairs of closely spaced delta wings, several structurally uncoupled 1/80th-scale models were studied by experiment and analysis. Flutter test boundaries run in a 26-in transonic blowdown wind tunnel were compared with subsonic analytical results generated using the doublet lattice method. Trends for several combinations of vertical and longitudinal wing separation showed that flutter speeds can be significantly lowered in closely spaced configurations. For some configurations, a new flutter mechanism, characterized by coupling of the flexible modes from both surfaces at a distinctive flutter frequency, was predicted and observed. Author

The relationships between performance, safety, cost, and schedule parameters were identified and quantified in support of an overall effort to generate program models and methodology that provide insight into a total space vehicle program. A specific space vehicle system, the attitude control system (ACS), was used, and a modeling methodology was selected that develops a consistent set of quantitative relationships among performance, safety, cost, and schedule, based on the characteristics of the components utilized in candidate mechanisms. These descriptive equations were developed for a three-axis, earth-pointing, mass expulsion ACS. A data base describing typical candidate ACS components was implemented, along with a computer program to perform sample calculations. This approach, implemented on a computer, is capable of determining the effect of a change in functional requirements to the ACS mechanization and the resulting cost and schedule. By a simple extension of this modeling methodology to the other systems in a space vehicle, a complete space vehicle model can be developed. Study results and recommendations are presented. Author

**TRANSPORTATION AND ENERGY**

W. E. Mooz Jun. 1973 23 p refs Presented at the 1st Annual Illinois Energy Conf., Chicago, 13-15 Jun. 1973 (Grant NSF G1-44)  
(P-5025) Avail: NTIS HC \$3.25 CSCL 21D

The use of energy in the transportation sector is discussed. Transportation in the United States presently uses about 25 percent of the total annual energy budget, and the use of energy in the sector is increasing at an average annual rate of about 4 percent per year. Over 95 percent of this energy is supplied by petroleum fuels, and the biggest users are motor vehicles. Differences in modal efficiencies are shown, with motor vehicles and aircraft the least efficient energy users. The growth in energy use by transportation is shown to be due to increasing modal energy intensiveness, shifts in traffic from low intensiveness modes to high intensiveness modes, and increasing per capita use of transportation. One may expect to see more small cars, shifts from air and highway modes to buses, trains, and pipelines, and changes in personal transportation habits. Author

Infrared Countermeasures, White Oak, Md., 10 Apr. 1973 Sponsored By AEC

(SLA-73-5271: Conf-730428-1) Avail: NTIS HC \$3.50

The AIRVAL program has conducted a survey to determine the extent of past infrared (IR) signature measurements on high-performance jet aircraft. The results of this survey have been used to categorize broadly aircraft signatures and to indicate areas requiring further signature measurement. Measurements on the F-102 are now underway at Naval Weapons Center. The results of these measurements will be compared to signature predictions of the F-102 as calculated by Grumman Aircraft Corp. Additional IR signature measurements will be made this calendar year on the A-3, A-4, A-7, F-4, F-5, and F-14 by the measurement groups at the Naval Missile Center and Eglin AFB using advanced instrumentation and techniques. The results of these measurements will be combined with target vulnerability models and missile guidance, fuze, and warhead characteristics in a computer model to determine the predicted outcome of missile/target encounters. The results of a drone firing program will be compared to the computer model predictions.

# SUBJECT INDEX

## Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The Notation of Content (NOC), rather than the title of the document, is usually used to provide a more exact description of the subject matter. (In some cases AIAA uses the title in lieu of an NOC.) The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the Notation of Content, e.g., N73-11019. Under any one subject heading, the accession numbers are arranged in sequence with the IAA accession numbers appearing first.

## A

Theory for predicting sonic boom intensity and techniques for sonic boom suppression  
[FAA-RD-73-4] N73-31944

Calculation procedures for predicting noise-time histories and noise contours for various types of aircraft  
[NASA-CR-114649] N73-31945

Computer programs for predicting the noise-time histories and noise contours for five types of aircraft  
[NASA-CR-114650] N73-31946

Analysis of jet engine noise to show sources of noise, noise spectra, and use of laminates and composite materials for noise reduction  
N73-32962

Characteristics of aerodynamic noise generated by interaction of airstream with flap surface to show location and control of noise sources  
N73-32963

Wind tunnel tests to determine acoustic properties of externally blown flap and augmentor wing for short takeoff aircraft configurations  
N73-32965

Method for predicting noise generated by deflecting engine exhaust for under-the-wing and over-the-wing versions of externally blown flap configuration  
[NASA-TM-X-71449] N73-32969

Wind tunnel tests to determine acoustic properties of large scale lift fan transport aircraft model  
[NASA-TM-X-62284] N73-32975

Relationship between distribution of outflow of acoustic energy over jet boundary and far-field intensity  
[NASA-TM-D-7269] N73-33181

## ACOUSTIC VELOCITY

Acoustic velocity and sound propagation  
differences in incompressible and compressible  
fluids related to Mach cone formation and sonic  
boom effects

A73-45269

## ADAPTIVE CONTROL

Sensitivity, adaptivity and optimality;  
Proceedings of the Third Symposium, Ischia,  
Italy, June 18-23, 1973.

A73-43277

Design of multivariable adaptive model following  
control systems.

A73-43288

## ADHESIVE BONDING

Adhesive bonding of structures and composite  
materials on advanced turbofan engines

N73-32470

## AERODYNAMIC CHARACTERISTICS

Aerodynamic wind tunnel performance of high bypass  
pressure ratio fan engine for STOL aircraft  
[NASA-TM-X-71445]

N73-31931

Wind tunnel tests to determine static and dynamic  
stability coefficients for circular cone with  
various nose bluntness configurations  
[AD-765164]

N73-31934

Computer program for analyzing characteristics of  
parachute-payload system during deployment and  
trajectory

N73-31936

Wind tunnel tests of high harmonic circulation  
control rotary wing model to show instruments  
required and data acquisition procedures  
[AD-765320]

N73-31984

Thrust augmentation, lift forces, and mixing  
properties of two-phase flow propulsion and lift  
system for ground effect machines  
[AD-765332]

N73-32208

Aerodynamic characteristics of flow around  
elliptic cones at large angles of attack  
[AD-764945]

N73-32209

Wind tunnel tests to determine aerodynamic  
characteristics of three oblique, high aspect  
ratio wing and body combinations at Mach numbers  
between 0.60 and 1.40

N73-32926

Wind tunnel tests to determine aerodynamic  
characteristics of oblique wing and body  
combination at Mach numbers between 0.60 and 1.40  
[NASA-TM-X-622071]

N73-32927

Objectives and findings of study to determine  
applicability of short takeoff aircraft for  
short-haul air transportation systems

N73-32936

Wind tunnel tests to determine aerodynamic  
characteristics of upper surface blown jet-flap  
concept incorporating high-bypass-ratio turbofan  
engines

N73-32943

Development and evaluation of active control  
system to provide ride smoothing on short  
takeoff aircraft

N73-32951

Transonic wind tunnel tests to determine lift,  
drag, and stability characteristics of F-8  
aircraft model with oblique wing  
[NASA-TM-X-62273]

N73-32974

Transonic wind tunnel tests to determine effects  
on flutter of aerodynamic interference between  
pairs of closely spaced delta wings  
[NASA-CR-23311]

N73-33887

## AERODYNAMIC COEFFICIENTS

Airfoil theory calculation of bent thin foil lift  
coefficient and longitudinal moment  
characteristics at arbitrary flow separation  
point location

A73-43720

Aerodynamic characteristics of augmentor wings and  
analysis of augmentation and entrainment in  
defining a net thrust coefficient

N73-32942

Wind tunnel tests to determine magnitude of  
adverse ground effects on longitudinal  
aerodynamic coefficients of powered-lift short  
takeoff aircraft

N73-32950

## AERODYNAMIC CONFIGURATIONS

Dirigible airship design, operations, payloads,  
cargo transportation and surveillance applications

A73-44223

Noise comparisons from full-scale fan tests at  
NASA Lewis Research Center.

[AIAA PAPER 73-1017] A73-44849

Acoustic investigation of the engine-over-the-wing  
concept using a D-shaped nozzle.

[AIAA PAPER 73-1030] A73-44860

Wind tunnel tests to determine flow distribution  
at inlet locations on aircraft model for various  
aerodynamic configurations and airspeeds

[NASA-TM-D-73641] N73-31929

Procedure for evaluating relative economic value  
of technology factors affecting design,  
configuration, and operation of hypersonic  
cruise transport

[NASA-CR-22861] N73-31953

Flight tests of modified F-106 aircraft to  
determine installation effects of two aft  
underwing nacelles housing afterburning J-85  
engines

[NASA-TM-X-71439] N73-31959

Aerodynamic design of inlet stage for two-stage  
compressor and performance comparison for axial,  
mixed flow, and centrifugal stage configurations  
[NASA-CR-120943]

N73-32610

Wind tunnel tests to determine aerodynamic  
characteristics of oblique wing and body  
combination at Mach numbers between 0.60 and 1.40  
[NASA-TM-X-622071]

N73-32927

Aerodynamic and performance characteristics of  
short takeoff aircraft equipped with externally  
blown flaps

N73-32939

Wind tunnel tests to determine stability and  
control characteristics of externally blown  
jet-flap configurations

N73-32940

Aerodynamic characteristics of augmentor wings and  
analysis of augmentation and entrainment in  
defining a net thrust coefficient

N73-32942

Wind tunnel tests to determine aerodynamic  
characteristics of five configurations of short  
takeoff aircraft wind tunnel models

N73-32944

Flight tests of augmentor-wing jet STOL research  
aircraft to compare wind tunnel data with flight  
data for dynamic characteristics and limitations

N73-32954

Wind tunnel tests to determine acoustic properties  
of externally blown flap and augmentor wing for  
short takeoff aircraft configurations

N73-32965

Aerodynamic noise characteristics of short takeoff  
aircraft with externally blown flaps and engines  
mounted over and under wing

N73-32966

Flight tests of Boeing 727 aircraft to determine  
effects of modifications on reduction of  
aerodynamic noise

[FAA-ED-72-40-VOL-3] N73-32971

Effect of inlet conditions on optimal shape of  
diffuser based on theory of potential flow of  
fluid in channels

[AD-765577] N73-33230

## AERODYNAMIC DRAG

Aerodynamic drag and lift of airships, noting  
boundary layer control by suction

N73-32994

Technical conditions for airship development,  
noting weight reduction, propulsion system  
performance, and maneuverability improvement

N73-32995

## AERODYNAMIC FORCES

Analysis of aerodynamic drag on object moving in  
rarefied gas under nearly free molecular flow  
conditions

N73-32923

On the effects of viscous interaction for a flat  
delta wing at incidence

[ARC-CP-1237] N73-32931

Development of instrument to measure steady and  
oscillatory aerodynamic forces on sting-mounted  
model using forced oscillation technique

[ATN-71011] N73-33366

**AERODYNAMIC INTERFERENCE**

Slotted transonic wind tunnel tests on pitching delta wing enable selection of porous walls for interference free damping derivatives  
[ARC-R/M-3715] N73-32930

**AERODYNAMIC LOADS**

Calculation of the deformations of a propeller blade in flight A73-43724  
A theoretical and experimental study of sound attenuation in an annular duct.  
[AIAA PAPER 73-1005] A73-44838

**AERODYNAMIC NOISE**

Supersonic jet noise generated by large scale disturbances.  
[AIAA PAPER 73-992] A73-44827  
Subsonic and supersonic jets and supersonic suppressor characteristics.  
[AIAA PAPER 73-999] A73-44834  
A difference theory for noise propagation in an acoustically lined duct with mean flow.  
[AIAA PAPER 73-1007] A73-44840  
The influence of aerodynamic flow noise in turbofan engines  
[AIAA PAPER 73-1016] A73-44848  
Progress in source noise suppression of subsonic tip speed fans.  
[AIAA PAPER 73-1032] A73-44861  
Comparison of results obtained with various sensors used to measure fluctuating quantities in jets  
[AIAA PAPER 73-1043] A73-44867  
Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer A73-44899  
Far field noise reduction of tilting rotor aircraft based on performance and weight tradeoffs to improve acoustic signatures  
[NASA-CR-114648] N73-31937  
Characteristics of aerodynamic noise generated by interaction of airstream with flap surface to show location and control of noise sources N73-32963

Acoustic measurements of aerodynamic noise produced by impingement of jet exhaust on wing and flap of externally blown flap system installed on F-111 aircraft N73-32964

Wind tunnel tests to determine acoustic properties of externally blown flap and augmentor wing for short takeoff aircraft configurations N73-32965

Method for predicting noise generated by deflecting engine exhaust for under-the-wing and over-the-wing versions of externally blown flap configuration  
[NASA-TM-X-71449] N73-32969

Flight tests of Boeing 727 aircraft to determine effects of modifications on reduction of aerodynamic noise  
[FAA-RD-72-40-VOL-3] N73-32971

Wind tunnel tests to determine acoustic properties of large scale lift fan transport aircraft model  
[NASA-TM-X-62284] N73-32975

Fluid mechanics of hole tone whistle designed as efficient producer of discrete frequency sound N73-33170

**AERODYNAMIC STALLING**

Design, development, and evaluation of automatic departure prevention system and stall inhibitor for A-7 aircraft  
[AD-764767] N73-31972

**AERODYNAMICS**

Aircraft aerodynamics problems covering slender body theory, atmospheric turbulence and boundary layers, wind tunnel contractions, radiator blocks, vortex induced oscillations, etc A73-44690

A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors. A73-45264

**AEROELASTICITY**

Calculation of the deformations of a propeller blade in flight A73-43724

**AERONAUTICAL ENGINEERING**

Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing A73-43911

Management and control of commercial flight test programs. A73-44057

Management and control of military and commercial flight test programs at Bell Helicopter Company. A73-44058

Air Force Prototype Program management. A73-44061

The role of a military flight test engineer in test management. A73-44062

The capabilities of army test facilities. A73-44064

Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships A73-44066

**AERONAUTICS**

Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements A73-45088

Economic evaluation of aircraft and spacecraft [JPRS-60104] N73-32907

**AEROSPACE ENGINEERING**

Economic evaluation of aircraft and spacecraft [JPRS-60104] N73-32907

**AFTERBURNING**

Flight tests of modified F-106 aircraft to determine installation effects of two aft underwing nacelles housing afterburning J-85 engines  
[NASA-TM-X-71439] N73-31959

Influence of combustion chamber, compressor, and afterburner configuration on static performance of two-cycle turbojet engines with high bypass ratio N73-33756

**AIR BREATHING ENGINES**

Hypersonic wind tunnel tests of air breathing engines N73-32158

Combustion process for airbreathing propulsion using fixed geometry ramjets N73-32626

**AIR CARGO**

Land-air-sea intermodal cargo container movement procedures and equipment design standardization to meet air transportability requirements  
[ASME PAPER 73-ICT-30] A73-43493

Dirigible airship design, operations, payloads, cargo transportation and surveillance applications A73-44223

Proceedings of conference on air transport industry with emphasis on economics, market demand, airlines regulation, and international transportation policy - Vol. 2  
[NASA-CR-135635] N73-32875

Analysis of economic factors involved in air cargo operations and air cargo market development N73-32881

Analysis of factors involved in developing market for air cargo services N73-32882

Analysis of air freight rate problems to define roles of Civil Aviation Board and domestic air carriers N73-32883

Research project to determine factors involved in expansion of air freight traffic and prospects for future expansion N73-32884

Application of airships to air transportation, noting cost effectiveness N73-32991

**AIR COOLING**

Thermodynamics of an air-cooled gas-turbine stage A73-43733

The problem of extrapolating test data on the efficiency of turbine-blade cooling to actual conditions A73-43741

## AIR FLOW

- Emissions from and within an Allison J-33 combustor, II - The effect of inlet air temperature. A73-43327
- Measurement of flow parameters in midspan double-circular-arc section of stator in subsonic flow and comparison with computed performance [NASA-TN-D-7425] N73-31932
- Shock wave pattern and stability in axial flow supersonic compressor using simulated rotating cascade test facility N73-32196
- Aerodynamic design of inlet stage for two-stage compressor and performance comparison for axial, mixed flow, and centrifugal stage configurations [NASA-CR-120943] N73-32610
- Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability N73-32922
- Characteristics of aerodynamic noise generated by interaction of airstream with flap surface to show location and control of noise sources N73-32963
- Relationship between distribution of outflow of acoustic energy over jet boundary and far-field intensity [NASA-TN-D-7269] N73-33181
- Pressure drop in air flow isothermally across bank of helically wound, L-type fin tubes [PB-220315/6] N73-33229
- AIR INTAKES**
- Experimental investigation of large scale, two dimensional, mixed compression inlet system [NASA-TN-D-7445] N73-31928
- Adjustable airfoil for reversible cowl flap inlet thrust augmentation [NASA-CASE-ARC-10754-1] N73-32624
- Characteristics of variable geometry high Mach inlet concepts to reduce jet engine noise on subsonic, long range commercial aircraft [NASA-CR-134495] N73-33748
- AIR NAVIGATION**
- The development of civil air navigation in the People's Republic of China - Agreements with other states as well as the tasks and the position of the China Civil Aviation Corporation /CAAC/ A73-45346
- AIR PIRACY**
- 'Air piracy' and the latest work of ICAO on this subject A73-45345
- AIR POLLUTION**
- Potential of hydrogen fuel for future air transportation systems. [ASME PAPER 73-ICT-104] A73-43499
- Research projects to determine effects of exhaust products from aircraft operating in stratosphere on global and local climatic conditions [UCRL-51336] N73-32296
- Effect of inlet air humidity on exhaust gas emissions of nitrogen oxides in gas turbine combustor [NASA-TN-D-7396] N73-32822
- AIR TO AIR MISSILES**
- Infrared signatures of high performance jet aircraft and evaluation of air to air missile effectiveness [SLA-73-5271] N73-33929
- AIR TRAFFIC**
- Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend [ASME PAPER 73-ICT-72] A73-43498
- Effects of transition from conventional to quiet takeoff and landing air traffic, noting introduction of microwave ILS and area navigation [MHB-UH-05-73-0] N73-32525
- International civil aviation organization for air traffic forecasting and airport development N73-32865

- Proceedings of conference on air transport industry with emphasis on economics, market demand, airlines regulation, and international transportation policy - Vol. 2 [NASA-CR-135635] N73-32875
- Organization, responsibilities, and functions of Civil Aeronautics Board in determining award of air routes to air lines N73-32880

## AIR TRAFFIC CONTROL

- NATREC test facilities. A73-44063
- Aviation law development regarding ATC influence on legal liability for aircraft accidents, analyzing controller error influence on liability determination A73-45444
- Numerical analysis of curved approach paths and landing sequence for multiple aircraft using same terminal facilities to provide maximum system performance N73-31935
- Analysis and simulation of intermittent positive control of air traffic by fully automated ground facility N73-32511
- Evaluation of air traffic control beacon alphanumeric system for automatic operation in low density airport towers and terminal facilities [FAA-NA-73-54] N73-32516
- Air traffic control evaluation to determine feasibility of combining smaller aircraft into gaps on flow of normal traffic to increase effectiveness of terminal facilities [FAA-APS-500-1] N73-32517
- Performance and environmental tests of National Air Space Enroute Stage air traffic control system [FAA-NA-73-55] N73-32518
- Air traffic control problems created by introduction of large numbers of STOL aircraft into high density terminal area N73-32956
- Development and characteristics of 4-D guidance system for traffic control of STOL aircraft operating in congested areas N73-32957
- Systems analysis of problems created in terminal area by application of short takeoff aircraft for providing high speed, short haul air transportation service N73-32958
- Evaluation of large screen display for automated oceanic air traffic control applications [FAA-ND-73-75] N73-33568
- Operational evaluation of ARTS 2 radar alphanumeric display subsystem [FAA-NA-73-77] N73-33569
- Restructuring of oceanic air traffic control airspace jurisdictional boundaries in presence of satellite system [FAA-RD-73-59] N73-33570
- Computer model of Los Angeles, California air traffic control situation to predict conditions expected by 1982 [AD-765153] N73-33571
- AIR TRANSPORTATION**
- Land-air-sea intermodal cargo container movement procedures and equipment design standardization to meet air transportability requirements [ASME PAPER 73-ICT-30] A73-43493
- Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend [ASME PAPER 73-ICT-72] A73-43498
- Short takeoff and landing /STOL/ aircraft technology developments for high density air transport, discussing lift system, handling, airfoil design, acoustics and operating economics A73-43520
- Dirigible airship design, operations, payloads, cargo transportation and surveillance applications A73-44223
- The transatlantic charter policy of the United States. A73-44575
- Economics, traffic demand, and community acceptance of short haul air transportation system in California Corridor - Vol. 1 [NASA-CR-114634] N73-32842

Economic factors, financial management, production and marketing for air transport industry [NASA-CR-135634] N73-32848  
Federal Government participation in development of US air transportation system N73-32850

Marketing and cost effectiveness in air transportation economics N73-32855

Economic efficiency in pricing of air transport services N73-32856

Demand factors in air transportation marketing N73-32863

Analytical forecasting methods for air passenger traffic N73-32864

Patterns of behavior of airlines and air travellers in air transportation network and effects on use of satellite airports N73-32876

Airport establishment and operation with emphasis on regional planning, social factors, and economic forces N73-32877

Procedures for conducting air traffic forecasts with emphasis on socio-economic and demographic characteristics of population N73-32879

Organization, responsibilities, and functions of Civil Aeronautics Board in determining award of air routes to air lines N73-32880

Analysis of economic factors involved in air cargo operations and air cargo market development N73-32881

Analysis of factors involved in developing market for air cargo services N73-32882

Analysis of air freight rate problems to define roles of Civil Aviation Board and domestic air carriers N73-32883

Evaluation of new forms of air transport service for improving short haul air travel market N73-32887

Federal policy establishing guidelines for US participation in international air transportation services N73-32902

Improving air transportation to low density population regions [NASA-CR-114484] N73-32905

Proceedings of conference on short takeoff and landing aircraft to determine aerodynamic characteristics and short haul transportation applications [NASA-SP-320] N73-32934

Analysis of short-haul air transportation requirements to include aircraft development programs, economic factors, and environmental considerations N73-32935

Technical and economic aspects of airship transportation [DLR-MITT-72-17] N73-32989

Application of airships to air transportation, noting cost effectiveness N73-32991

Use of energy in transportation and implications for future [P-5025] N73-33921

#### AIRBORNE EQUIPMENT

Land-air-sea intermodal cargo container movement procedures and equipment design standardization to meet air transportability requirements [ASME PAPER 73-ICT-30] A73-43493

Annual variations of Garda Lake surface temperature using airborne bolometric equipment and earth based infrared video equipment [IPA-STR-23] N73-32298

Digital synchronization of airborne collision avoidance systems [DLR-PAPER-73-012] N73-32519

#### AIRBORNE/SPACEBORNE COMPUTERS

Airborne computer role in digital flight control systems, noting systems model, man machine interface, and integration N73-32982

#### AIRCRAFT ACCIDENTS

Aviation law development regarding ATC influence on legal liability for aircraft accidents, analyzing controller error influence on liability determination A73-45444

Statistical analysis of aircraft accidents occurring in US Civil Aviation during calendar year 1972 - Issue 5 [NTSB-BA-73-7] N73-31942

Aircraft accident involving Boeing 707 aircraft following aborted takeoff at Kennedy International Airport, New York, on 13 August, 1972 [NTSB-AAR-73-7] N73-31943

Analysis of flight crew errors contributing to aircraft accidents on P-3 and F-4 aircraft for improved air safety [AD-764868] N73-31979

Test data and description of unsymmetrical crash analysis computer program for improved helicopter structural crashworthiness analytical and design techniques - Vol. 2 [AD-764986] N73-31986

Computer program and mathematical model for predicting dynamic response of helicopter in accident involving vertical and lateral impact [AD-764985] N73-32996

#### AIRCRAFT ANTENNAS

Dielectric lightweight aircraft radar antenna array [AD-764685] N73-32131

#### AIRCRAFT CARRIERS

The transatlantic charter policy of the United States. A73-44575

#### AIRCRAFT COMPARTMENTS

Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers. A73-44377

Research and development projects concerning fire hazards in aircraft cabins and design of aircraft compartments to provide greater passenger survivability [FAA-RD-73-146] N73-32972

#### AIRCRAFT CONFIGURATIONS

Airport runway and taxiing surfaces modifications for heavy and supersonic aircraft demonstrated by aircraft static and dynamic landing loads and physical dimensions A73-45199

Theory for predicting sonic boom intensity and techniques for sonic boom suppression [FAA-RD-73-4] N73-31944

Nozzle geometry and forward velocity effects on noise for CTOL engine-over-wing concept [NASA-TN-X-71453] N73-33742

#### AIRCRAFT CONTROL

Design of multivariable adaptive model following control systems. A73-43288

Closed loop linear control system synthesis possibility under condition of incomplete information on state vector with application to aircraft longitudinal motion A73-44329

Total In-Flight Simulator for X-22A aircraft based on variable stability-and-control system concept for reliability design A73-45153

Electronic display devices in aircraft control, noting pilot activation and VTOL control [DLR-MITT-72-04] N73-32998

Extrapolation predictive displays for manual path and position control of VTOL aircraft N73-33000

#### AIRCRAFT DESIGN

On the application of a new version of lifting surface theory to nonslender and kinked wings. A73-43210

Designing a slender-wing-type cantilever plate under conditions of unsteady creep A73-43728

On problems of flight over an extended angle-of-attack range. A73-44692

- F-14 replacement for Phantom aircraft for escort missions, fleet defence, interdiction and close support, discussing airborne refuelling capability and composite materials applications  
A73-44695
- A study to determine the feasibility of a low sonic boom supersonic transport.  
[AIAA PAPER 73-1035] A73-44863
- Application of short takeoff aircraft for short haul air transportation with identification of critical technology, economics, and social viability  
[NASA-CR-135481] N73-31941
- Procedure for evaluating relative economic value of technology factors affecting design, configuration, and operation of hypersonic cruise transport  
[NASA-CR-2286] N73-31953
- Design parameters for optimal cost/cruise performance of subsonic jet transport  
N73-32853
- Analysis of short-haul air transportation requirements to include aircraft development programs, economic factors, and environmental considerations  
N73-32935
- Objectives and findings of study to determine applicability of short takeoff aircraft for short-haul air transportation systems  
N73-32936
- Economic and environmental aspects of short takeoff aircraft used for short-haul air transportation systems  
N73-32937
- Short takeoff aircraft technology development related to requirements for expanded and improved short-haul air transportation system capabilities  
N73-32938
- Characteristics and performance of piloted simulator for application as research tool in design and development of experimental aircraft  
N73-32955
- Program plan to develop criteria for airworthiness standards applied to short takeoff aircraft used as transport service  
N73-32959
- AIRCRAFT ENGINES**
- Technological change measurement methodology for cost and production estimates with application to aircraft turbine engine development  
A73-44219
- Low frequency noise generation within aircraft gas turbine engine core portion, discussing sources prediction, model and full scale engine tests, and future technology  
[AIAA PAPER 73-1027] A73-44858
- AC starter generator featuring variable-to-constant frequency conversion by cycloconverters as switching device for use with aircraft engines  
A73-45154
- Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage  
A73-45155
- Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure  
A73-45475
- Research projects to determine effects of exhaust products from aircraft operating in stratosphere on global and local climatic conditions  
[UCRL-51336] N73-32296
- Wind tunnel tests to determine aerodynamic loads on flap systems behind engines and vibration modes of flap system  
N73-32945
- Design and development of quiet, clean propulsion systems for short takeoff aircraft with emphasis on engine noise reduction  
N73-32961
- Analysis of jet engine noise to show sources of noise, noise spectra, and use of laminates and composite materials for noise reduction  
N73-32962
- Selection criteria and characteristics of quiet, clean propulsion systems for use with short takeoff aircraft  
N73-32967
- Computer program for evaluating techniques to improve aircraft engine response systems for application to long range commercial aircraft  
[NASA-CR-134496] N73-32977
- Investigations of HT-3/PHR-PI composites for applications to advanced aircraft engines  
[NASA-TN-X-71459] N73-33502
- AIRCRAFT EQUIPMENT**
- Aircraft accident involving Boeing 707 aircraft following aborted takeoff at Kennedy International Airport, New York, on 13 August, 1972  
[NTSB-AAR-73-7] N73-31943

Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel.  
[AIAA PAPER 73-1047] A73-44871

Comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors.  
A73-45264

Maplin airport planning history, noise reduction features and government surveys, noting future air traffic trends and planning alternatives  
A73-45373

Aircraft noise reduction alternatives for operational aircraft, noting noise generation upstream of final nozzle, reengining, refanning and suppressor techniques  
A73-45374

Calculation procedures for predicting noise-time histories and noise contours for various types of aircraft  
[NASA-CR-114649] N73-31945

Computer programs for predicting the noise-time histories and noise contours for five types of aircraft  
[NASA-CR-114650] N73-31946

**AIRCRAFT PERFORMANCE**

Potential of hydrogen fuel for future air transportation systems.  
[ASME PAPER 73-ICT-104] A73-43499

Takeoff and landing performance characteristics and field length requirements for jet short takeoff transport aircraft with full span, externally blown flaps  
[NASA-TN-D-74411] N73-31939

Wind tunnel tests to determine low speed characteristics of large scale model of F-14A aircraft with emphasis on high lift configuration stability  
[NASA-TN-X-62244] N73-31940

Mathematical model for real time simulation of tilt rotor aircraft to evaluate aircraft performance and handling qualities  
[NASA-CR-114601] N73-31947

Flight test of structural mode control system installed in XB-70 aircraft to determine effectiveness of system under turbulent conditions  
[NASA-TN-D-7420] N73-31950

Stability and control characteristics of XB-70 aircraft at airspeeds up to Mach 3.0 and addition of lateral bobweight as auxiliary stabilization device  
[NASA-TN-X-2933] N73-31958

Rotary wing aircraft steep instrument approach limits  
[MBB-UD-101-73-0] N73-31969

Design, development, and evaluation of automatic departure prevention system and stall inhibitor for A-7 aircraft  
[AD-764767] N73-31972

Pilot rating of fighter aircraft in precision heading task using mathematical model for predicting aircraft performance  
[AD-764695] N73-31973

Mathematical model for predicting pilot rating of aircraft in pitch tracking under gust conditions  
[AD-764698] N73-31976

Flight simulation to determine manual control of flight path and airspeed for approach and landing of powered lift jet short takeoff aircraft  
N73-32949

Characteristics and performance of piloted simulator for application as research tool in design and development of experimental aircraft  
N73-32955

Effect of artificial longitudinal stability on aircraft performance, based on control configured vehicle concept  
N73-32986

**AIRCRAFT PRODUCTION**

Analysis of factors affecting future of commercial aircraft development to show effects on overall airline operations  
N73-32900

**AIRCRAFT RELIABILITY**

Management and control of flight test programs at U.S. Army Aviation Systems Command.  
A73-44054

Program plan to develop airworthiness standards for STOL aircraft.  
A73-44994

Program plan to develop criteria for airworthiness standards applied to short takeoff aircraft used as transport service  
N73-32959

**AIRCRAFT SAFETY**

USA government and industry efforts on aircraft midair collision avoidance systems technology advancement, comparing cost effectiveness between airborne and ground based options  
[ASME PAPER 73-ICT-49] A73-43495

'Air piracy' and the latest work of ICAO on this subject  
A73-45345

Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure  
[AD-764941] A73-45475

Program plan to develop criteria for airworthiness standards applied to short takeoff aircraft used as transport service  
N73-32959

Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir  
[AD-764941] N73-33740

Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135903] N73-33919

Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135902] N73-33920

## AIRCRAFT SPECIFICATIONS

F-14 replacement for Phantom aircraft for escort missions, fleet defence, interdiction and close support, discussing airborne refuelling capability and composite materials applications  
A73-44695

## AIRCRAFT STABILITY

A study of a fluidic open loop damping flight stability augmentation system.  
A73-43396

Total In-Flight Simulator for X-22A aircraft based on variable stability-and-control system concept for reliability design  
A73-45153

Flight test of structural mode control system installed in XB-70 aircraft to determine effectiveness of system under turbulent conditions [NASA-TN-D-7420]  
N73-31950

Stability and control characteristics of XB-70 aircraft at airspeeds up to Mach 3.0 and addition of lateral bobweight as auxiliary stabilization device [NASA-TN-X-2933]  
N73-31958

Jet aircraft flight tests for stability derivative determination comparing various measuring techniques [BMVG-PBWT-73-121]  
N73-31971

Computer program for predicting pilot rating of pitch stability of T-33 aircraft under vertical turbulence conditions [AD-764696]  
N73-31974

Computerized simulation of DC-8 aircraft during landing approach under wind shear conditions [AD-764697]  
N73-31975

Mathematical model for predicting pilot rating of aircraft in pitch tracking under gust conditions [AD-764698]  
N73-31976

Development and evaluation of active control system to provide ride smoothing on short takeoff aircraft  
N73-32951

Requirements of flight control systems with regard to aircraft stability and attitude control [DLR-MITT-72-05]  
N73-32978

Nonlinear feedback control concepts for variable stability aircraft  
N73-32979

Effect of artificial longitudinal stability on aircraft performance, based on control configured vehicle concept  
N73-32986

Effects of artificial aircraft stability control on damping, and static stability recovery by controllers  
N73-32987

Design of pitching axis control system for aircraft with artificial stability  
N73-32988

## AIRCRAFT STRUCTURES

The effect of variable environment temperature on heat transfer in extended surfaces.  
A73-43296

Environmental effects on fracture resistant and biaxial fatigue design of aircraft structures.  
A73-43811

Acoustic fatigue resistance of aircraft structures at elevated temperatures.  
A73-44829

R and D efforts for various aircraft construction materials, considering steels, alloys and fiber-containing laminates  
A73-45198

## AIRCRAFT TIRES

Design requirements and characteristics of toroidal, continuous wound aircraft tire [AD-764888]  
N73-31977

## AIRCRAFT WAKES

Sound generation by wake cutting.  
[AIAA PAPER 73-1019]  
A73-44851

Analysis of random motions of vortex elements behind aircraft wing and design of vortex arrays to reduce wake-vortex to small aircraft [NASA-TN-X-62304]  
N73-32976

## AIRFOIL PROFILES

Short takeoff and landing /STOL/ aircraft technology developments for high density air transport, discussing lift system, handling, airfoil design, acoustics and operating economics  
A73-43520

## AIRFOILS

Broadband noise generation by aerofoils and axial flow fans.  
[AIAA PAPER 73-1018]  
A73-44850

Sound generation by wake cutting.  
[AIAA PAPER 73-1019]  
A73-44851

Some results from tests in the NAE high Reynolds number two-dimensional test facility on shockless and other airfoils.  
A73-44995

Designing axial compressor airfoils with camber lines of arbitrary shape  
[AD-765165]  
N73-32636

## AIRFRAMES

Application of reliability analysis to aircraft structures subject to fatigue crack growth and periodic structural inspection  
[AD-764775]  
N73-32383

Application of radiation technology and equipment for nondestructive analysis of commercial aircraft structures during aircraft maintenance periods  
N73-33579

## AIRLINE OPERATIONS

Air carrier and general aviation airports system planning with emphasis on economic analysis of operation, ownership and finance  
[ASME PAPER 73-ICT-33]  
A73-43494

Dual lane runway configuration design and operational characteristics investigation by real time computer simulation for solution to airport capacity problem  
[ASME PAPER 73-ICT-61]  
A73-43496

Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend [ASME PAPER 73-ICT-72]  
A73-43498

The transatlantic charter policy of the United States.  
A73-44575

The development of civil air navigation in the People's Republic of China - Agreements with other states as well as the tasks and the position of the China Civil Aviation Corporation /CAAC/  
A73-45346

Aircraft noise reduction alternatives for operational aircraft, noting noise generation upstream of final nozzle, reengining, refanning and suppressor techniques  
A73-45374

Liability and insurance in international air traffic  
A73-45443

Application of short takeoff aircraft for short haul air transportation with identification of critical technology, economics, and social viability  
[NASA-CR-135481]  
N73-31941

Aircraft landing problems under low visibility weather conditions  
[DGLR-PAPER-73-015]  
N73-32520

New type of instrument landing systems, according to ICAO requirements  
[DGLR-PAPER-73-011]  
N73-32522

Economics, traffic demand, and community acceptance of short haul air transportation system in California Corridor - Vol. 1  
[NASA-CR-114634]  
N73-32842

Forecast model for predicting economic factors involved in short haul air transportation in California Corridor - Vol. 2  
[NASA-CR-114634 (1)]  
N73-32843

Method for estimating airline operating costs  
N73-32851

Formula for computing operating cost of turbine powered transport aircraft  
N73-32852

Differential pricing policy in airline operations  
N73-32857

Competition effects on air transportation industry economics  
N73-32858

Financial sources and airline operations  
N73-32859

Estimated costs for additional aircraft in air transport industry  
N73-32860

Financial requirements of air transportation industry

Bibliography of technical reports of helicopter engines and rotary wings [AD-764900] N73-31981
- BIT SYNCHRONIZATION**  
Digital synchronization of airborne collision avoidance systems [DGLR-PAPER-73-012] N73-32519
- BLADE TIPS**  
Capacitive method for measuring blade tip clearance in running turbocompressors [DLP-FB-72-40] N73-32628
- BO-105 HELICOPTER**  
Design optimization and testing of flight control systems for light helicopters, applied to BO-105 helicopter N73-32985
- BODIES OF REVOLUTION**  
Universal equations for the laminar boundary layer on a body of revolution in oblique flow A73-45529  
Determination of the impulses and moments imparted by shock waves to bodies of revolution A73-45542
- BODY-WING CONFIGURATIONS**  
Wind tunnel tests to determine aerodynamic characteristics of three oblique, high aspect ratio wing and body combinations at Mach numbers between 0.60 and 1.40. [NASA-TN-X-62256] N73-32926
- BOEING 707 AIRCRAFT**  
Aircraft accident involving Boeing 707 aircraft following aborted takeoff at Kennedy International Airport, New York, on 13 August, 1972 [NTSB-AR-73-7] N73-31943  
Longitudinal stability of Boeing 707 aircraft during steep approach, for noise reduction [DGLR-PAPER-73-023] N73-31963  
Specification of thrust control system for Airbus A 300-B, tested in Boeing 707 N73-32981
- BOEING 727 AIRCRAFT**  
Flight tests of Boeing 727 aircraft to determine effects of modifications on reduction of aerodynamic noise [FAA-RD-72-40-VOL-3] N73-32971
- BOUNDARY LAYER CONTROL**  
Aerodynamic drag and lift of airships, noting boundary layer control by suction N73-32994
- BOUNDARY LAYER EQUATIONS**  
Universal equations for the laminar boundary layer on a body of revolution in oblique flow A73-45529
- BOUNDARY LAYER FLOW**  
Flow interference between supersonic intake and airframe to show three dimensional separation of boundary layer N73-32194  
Turbulent shear stress profiles in boundary layer flow at sine wave pressure perturbations N73-33194
- BOUNDARY LAYER SEPARATION**  
Flow interference between supersonic intake and airframe to show three dimensional separation of boundary layer N73-32194
- BRAZING**  
Aluminum brazed titanium honeycomb sandwich structure - A new system. A73-44000
- BROADBAND**  
A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors. A73-45264
- BUFFETING**  
Aerothermodynamic study of air cushion vehicles buffeting noting dynamical stability, nonlinear behavior, and similitude law [NT-33-1973] N73-32933
- BURNING RATE**  
Burning rate studies of fuel air mixtures at high pressures. A73-45162  
Fuel combustion rate and turbulent diffusion induced self ignition in pulsejet engine combustion chamber from schlieren photography and pressure distribution measurements A73-45377
- C**
- CANADA**  
Pilot knee ejection clearances for Canadian military aircraft [DCIEH-936] N73-31938

## CANTILEVER PLATES

Designing a slender-wing-type cantilever plate under conditions of unsteady creep  
A73-43728

## CAPACITY

Excess capacity in airline industry and operational and financial problems  
N73-32871

## CASCADE FLOW

Total pressure loss distribution in viscous gas flow through annular cascades of axial flow compressors, examining three dimensional flow effects on boundary layer development  
A73-44916

Shock wave pattern and stability in axial flow supersonic compressor using simulated rotating cascade test facility  
N73-32196

## CAVITATION FLOW

Approximate calculation of the cavitation flow past low-aspect-ratio wings  
A73-45540

## CAVITY RESONATORS

PDP 8/I data acquisition and averaging program for synchronous hot-wire measurements in mouth of flow excited cavity resonator  
[AD-764851]  
N73-32357

## CENTRIFUGAL PUMPS

Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine  
A73-43742

## CERION

On the process of precipitation in Mg-Ce alloy.  
A73-44155

## CERTIFICATION

Management and control of flight test programs of the Western Region FAA.  
A73-44053

Management and control of flight test programs at U.S. Army Aviation Systems Command.  
A73-44054

## CHANNEL FLOW

Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel  
A73-44702

## CHEMICAL COMPOSITION

The effect of composition changes on the fracture toughness of an Al-Zn-Mg-Cu-Mn forging alloy.  
A73-44025

## CHEMICAL PROPERTIES

Physical and chemical properties of JP-4 jet fuel for 1972  
[AD-764690]  
N73-32605

## CIRCUIT PROTECTION

Fixed installation ground electrical power supply system for aircraft service, discussing motor-alternators, plant control cubicles, selector and busbar switchboxes and fault protection devices  
A73-45156

## CIRCULAR POLARIZATION

Improvement of instrument landing systems with respect to multipath propagation effects and surface reflections  
[DGLR-PAPER-73-017]  
N73-32521

## CIVIL AVIATION

Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend  
[ASHE PAPER 73-ICT-72]  
A73-43498

The development of civil air navigation in the People's Republic of China - Agreements with other states as well as the tasks and the position of the China Civil Aviation Corporation /CAAC/  
A73-45346

Statistical analysis of aircraft accidents occurring in US Civil Aviation during calendar year 1972 - Issue 5  
[NTSB-BA-73-7]  
N73-31942

International civil aviation organization for air traffic forecasting and airport development  
N73-32865

Application of airships to air transportation, noting cost effectiveness  
N73-32991

Acquisition of conditions of icing on modern civil transport aircraft from flight data  
N73-33528

## CLEARANCES

Pilot knee ejection clearances for Canadian military aircrafts  
[DCIEN-936]  
N73-31938

Capacitive method for measuring blade tip clearance in running turbocompressors  
[DLR-FB-72-40]  
N73-32628

## COANDA EFFECT

Wind tunnel tests of high harmonic circulation control rotary wing model to show instruments required and data acquisition procedures  
[AD-765320]  
N73-31984

Wind tunnel tests of large scale subsonic jet transport with upper surface blowing flap system for lift augmentation  
[NASA-TM-X-62296]  
N73-32973

## COCKPITS

Cockpit layouts in view of new landing approach methods  
[MBB-UH-07-73-0]  
N73-31966

Logic and design procedures for multifunction mode switching controls in jet aircraft cockpits  
[AD-764617]  
N73-32141

## COLLISION AVOIDANCE

USA government and industry efforts on aircraft midair collision avoidance systems technology advancement, comparing cost effectiveness between airborne and ground based options  
[ASHE PAPER 73-ICT-49]  
A73-43495

Digital synchronization of airborne collision avoidance systems  
[DGLR-PAPER-73-012]  
N73-32519

Evaluation of large screen display for automated oceanic air traffic control applications  
[FAA-ND-73-75]  
N73-33568

## COMBAT

Remotely piloted vehicle /RPV/ for reconnaissance, electronic warfare systems, target acquisition, weapon delivery, air-air combat and different combinations  
A73-45399

## COMBUSTIBLE FLOW

Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel  
A73-44702

## COMBUSTION CHAMBERS

Emissions from and within an Allison J-33 combustor. II - The effect of inlet air temperature.  
A73-43327

Turbofan engine core noise prediction and measurement, considering sources from flow passage obstructions, combustion chamber and turbine noise due to interaction with upstream turbulence  
[AIAA PAPER 73-1026]  
A73-44857

Some comments to mathematical interpretation of performance characteristics of jet engine combustion chambers.  
A73-45381

Combustion process for airbreathing propulsion using fixed geometry ramjets  
N73-32626

Emission abatement in aircraft gas turbine combustor with low mass emissions  
[AD-764987]  
N73-32638

Forward velocity effects on jet noise with dominant internal noise source  
[NASA-TM-X-71438]  
N73-32968

Influence of combustion chamber, compressor, and afterburner configuration on static performance of two-cycle turbojet engines with high bypass ratio  
N73-33756

## COMBUSTION EFFICIENCY

Some comments to mathematical interpretation of performance characteristics of jet engine combustion chambers.  
A73-45381

## COMBUSTION PRODUCTS

Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer  
A73-45076

- Research projects to determine effects of exhaust products from aircraft operating in stratosphere on global and local climatic conditions [UCRL-51336] N73-32296
- Sensory odor tests of exhaust from turbojet engine combustor operating at simulated idle conditions [NASA-TN-X-71429] N73-32613
- COMBUSTION VIBRATION**
- Noise generation by turbulent combustion, discussing sound power, spectral content, enclosure effect, and importance in turbopropulsion system core engine noise [AIAA PAPER 73-1023] A73-44855
- COMMERCIAL AIRCRAFT**
- Management and control of commercial flight test programs. A73-44057
- Development of US commercial air transport industry N73-32849
- Federal Government participation in development of US air transportation system N73-32850
- Proceedings of conference on air transport industry with emphasis on economics, market demand, airlines regulation, and international transportation policy - Vol. 2 [NASA-CR-135635] N73-32875
- Analysis of factors affecting future of commercial aircraft development to show effects on overall airline operations N73-32900
- Application of radiation technology and equipment for nondestructive analysis of commercial aircraft structures during aircraft maintenance periods N73-33579
- COMMUNICATION EQUIPMENT**
- Applications of spread spectrum communications techniques to avionics systems N73-32058
- COMMUNICATION SATELLITES**
- Aims, prospects, organization, and financing of EUROSAT S.A. N73-33930
- COMMUNICATION THEORY**
- Applications of spread spectrum communications techniques to avionics systems N73-32058
- COMPETITION**
- Competition effects on air transportation industry economics N73-32858
- COMPOSITE MATERIALS**
- F-14 replacement for Phantom aircraft for escort missions, fleet defence, interdiction and close support, discussing airborne refuelling capability and composite materials applications A73-44695
- Toward reliable composites - An examination of design methodology A73-45144
- Adhesive bonding of structures and composite materials on advanced turbofan engines N73-32470
- Investigations of HT-S/PMR-PI composites for applications to advanced aircraft engines [NASA-TN-X-71459] N73-33502
- COMPRESSIBLE FLUIDS**
- Acoustic velocity and sound propagation differences in incompressible and compressible fluids related to Mach cone formation and sonic boom effects A73-45269
- COMPRESSOR BLADES**
- Investigations of HT-S/PMR-PI composites for applications to advanced aircraft engines [NASA-TN-X-71459] N73-33502
- COMPRESSOR ROTORS**
- Effects of blade tip clearance and leading edge sweepback of compressor rotor blades on inducer performance and blade pressure loading [NASA-CR-72712] N73-31930
- COMPUTATION**
- Formula for computing operating cost of turbine powered transport aircraft N73-32852
- COMPUTER PROGRAMS**
- Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements A73-45088
- Computer program for analyzing characteristics of parachute-payload system during deployment and trajectory N73-31936
- Computer programs for predicting the noise-time histories and noise contours for five types of aircraft [NASA-CR-114650] N73-31946
- Test data and description of unsymmetrical crash analysis computer program for improved helicopter structural crashworthiness analytical and design techniques - Vol. 2 [AD-764986] N73-31986
- PDP 8/I data acquisition and averaging program for synchronous hot-wire measurements in mouth of flow excited cavity resonator [AD-764851] N73-32357
- Computerized design of axial compressor [AD-764733] N73-32633
- Computer program for design of axial compressor [AD-764734] N73-32634
- Computer program for evaluating techniques to improve aircraft engine response systems for application to long range commercial aircraft [NASA-CR-134496] N73-32977
- Computer program and mathematical model for predicting dynamic response of helicopter in accident involving vertical and lateral impact [AD-764985] N73-32996
- Computer solutions for potential and viscous flow calculations for engine inlets [NASA-TN-X-71457] N73-33184
- COMPUTERIZED DESIGN**
- Computerized design of axial compressor [AD-764733] N73-32633
- Computer program for design of axial compressor [AD-764734] N73-32634
- COMPUTERIZED SIMULATION**
- Dual lane runway configuration design and operational characteristics investigation by real time computer simulation for solution to airport capacity problem [ASME PAPER 73-ICT-61] A73-43496
- Computerized simulation of DC-8 aircraft during landing approach under wind shear conditions [AD-764697] N73-31975
- Computerized simulation of interactions of VTOL aircraft taking off from or landing on deck of ship moving in irregular or random seaway [AD-764865] N73-31980
- Computer model of Los Angeles, California air traffic control situation to predict conditions expected by 1982 [AD-765153] N73-33571
- CONFERENCES**
- Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973. A73-43277
- Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings. A73-44052
- Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews [AGARD-AR-62] N73-31954
- Proceedings of conference on air transport industry with emphasis on economics, market demand, airlines regulation, and international transportation policy - Vol. 2 [NASA-CR-135635] N73-32875
- Proceedings of conference on short takeoff and landing aircraft to determine aerodynamic characteristics and short haul transportation applications [NASA-SP-320] N73-32934
- Requirements of flight control systems with regard to aircraft stability and attitude control [DLR-MITT-72-05] N73-32978
- Technical and economic aspects of airship transportation [DLR-MITT-72-17] N73-32989

- Electronic display devices in aircraft control,  
noting pilot activation and VTOL control  
[DLR-HITT-72-04] N73-32998
- Turbojet and turbine engine performance  
optimization by configuration variations, and  
auxiliary turbine engine converter problem  
[DLR-HITT-73-05] N73-33755
- CONGRESS**  
Congressional hearings on causes and implications  
of impending shortages of gasoline, heating oil,  
diesel fuel, jet fuel, and electricity N73-33928
- CONICAL BODIES**  
Wind tunnel tests to determine static and dynamic  
stability coefficients for circular cone with  
various nose bluntness configurations  
[AD-765164] N73-31934
- Aerodynamic characteristics of flow around  
elliptic cones at large angles of attack  
[AD-764945] N73-32209
- CONSTRUCTION MATERIALS**  
Low-pressure prepreps as structural material for  
light-construction designs A73-44887
- R and D efforts for various aircraft construction  
materials, considering steels, alloys and  
fiber-containing laminates A73-45198
- Research and development projects concerning fire  
hazards in aircraft cabins and design of  
aircraft compartments to provide greater  
passenger survivability  
[FAA-RD-73-146] N73-32972
- CONSUMERS**  
Consumer marketing for airline industry N73-32873
- Concepts of expanding airline marketing strategies  
N73-32874
- CONTAINERS**  
Land-air-sea intermodal cargo container movement  
procedures and equipment design standardization  
to meet air transportability requirements  
[ASME PAPER 73-ICT-30] A73-43493
- CONTRACT MANAGEMENT**  
Management and control of flight test programs at  
U.S. Army Aviation Systems Command. A73-44054
- Management and control of flight test programs of  
the Naval Air Systems Command. A73-44056
- Management and control of military flight test  
programs at McDonnell Douglas St. Louis, Missouri.  
A73-44059
- Flight test programs management and control,  
considering weapon systems performance tests  
relative to contractual requirements, personnel  
allocation and supporting facilities A73-44060
- CONTROL THEORY**  
Sensitivity, adaptivity and optimality;  
Proceedings of the Third Symposium, Ischia,  
Italy, June 18-23, 1973. A73-43277
- Closed loop linear control system synthesis  
possibility under condition of incomplete  
information on state vector with application to  
aircraft longitudinal motion A73-44329
- COOLING**  
Performance evaluation of model energy separators  
[AD-764585] N73-32381
- COOLING SYSTEMS**  
Thermodynamics of an air-cooled gas-turbine stage  
A73-43733
- The problem of extrapolating test data on the  
efficiency of turbine-blade cooling to actual  
conditions A73-43741
- CORE FLOW**  
Wake development on models of elliptic,  
rectangular, swept and delta planforms when  
plunged in water  
[ARC-CP-1238] N73-32932
- CORROSION RESISTANCE**  
Improvement of the corrosion-fatigue strength of  
aluminum alloys by exposure of the medium to a  
magnetic field A73-43466
- Aluminum brazed titanium honeycomb sandwich  
structure - A new system. A73-44000
- COST ANALYSIS**  
Development and operation of cost accounting  
system for airport functions to show application  
of data processing equipment N73-32878
- Operation of low cost local air service carriers  
to show methods for improving transportation  
services N73-32886
- Optimization of control and damping system for  
fighter aircraft with quadratic cost function  
N73-32980
- Relationships between performance, safety, cost,  
and schedule parameters to generate program  
models for total space program  
[NASA-CR-135903] N73-33919
- Relationships between performance, safety, cost,  
and schedule parameters to generate program  
models for total space program  
[NASA-CR-135902] N73-33920
- COST EFFECTIVENESS**  
USA government and industry efforts on aircraft  
midair collision avoidance systems technology  
advancement, comparing cost effectiveness  
between airborne and ground based options  
[ASME PAPER 73-ICT-49] A73-43495
- Design parameters for optimal cost/cruise  
performance of subsonic jet transport N73-32853
- Principles of functional economic analysis N73-32854
- Differential pricing policy in airline operations  
N73-32857
- Financial sources and airline operations  
N73-32859
- Application of airships to air transportation,  
noting cost effectiveness N73-32991
- COST ESTIMATES**  
Technological change measurement methodology for  
cost and production estimates with application  
to aircraft turbine engine development A73-44219
- Method for estimating airline operating costs  
N73-32851
- Formula for computing operating cost of turbine  
powered transport aircraft N73-32852
- Estimated costs for additional aircraft in air  
transport industry N73-32860
- CRACK PROPAGATION**  
Fatigue crack growth retardation after  
single-cycle peak overload in Ti-6Al-4V titanium  
alloy. A73-43809
- Application of reliability analysis to aircraft  
structures subject to fatigue crack growth and  
periodic structural inspection  
[AD-764775] N73-32383
- CRACKING (FRACTURING)**  
Fracture analysis of surface- and through-cracked  
sheets and plates. A73-43813
- CREEP PROPERTIES**  
Designing a slender-wing-type cantilever plate  
under conditions of unsteady creep A73-43728
- CREEP RUPTURE STRENGTH**  
Aluminum brazed titanium honeycomb sandwich  
structure - A new system. A73-44000
- CRITICAL LOADING**  
Fatigue crack growth retardation after  
single-cycle peak overload in Ti-6Al-4V titanium  
alloy. A73-43809
- CRITICAL VELOCITY**  
Increasing the critical rotational speed of the  
tail rotor drive shaft in SH-1 and SH-2  
helicopters A73-45195
- CRYOGENICS**  
Flight tests of cryogenically cooled hygrometer  
[AD-764718] N73-32354

## CRYSTAL LATTICES

Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators

A73-44294

## CV-340 AIRCRAFT

Evaluation of approach and landing performance of inertial navigation system with Kalman filter installed in CV-340 aircraft  
[NASA-TN-D-73021]

N73-32515

## CYCLIC LOADS

Fatigue crack growth retardation after single-cycle peak overload in Ti-6Al-4V titanium alloy.

A73-43809

## CYLINDRICAL SHELLS

Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers.

A73-44377

## D

## DATA ACQUISITION

Wind tunnel tests of high harmonic circulation control rotary wing model to show instruments required and data acquisition procedures  
[AD-7653201]

N73-31984

## DATA MANAGEMENT

Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements

A73-45088

## DATA PROCESSING

Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements

A73-45088

## DATA PROCESSING EQUIPMENT

Development and operation of cost accounting system for airport functions to show application of data processing equipment

N73-32878

## DC 8 AIRCRAFT

Computerized simulation of DC-8 aircraft during landing approach under wind shear conditions  
[AD-7646971]

N73-31975

## DECISION MAKING

Utilization of decision and value theory concepts by helicopter pilots to plan attacks

N73-33565

## DELTA WINGS

Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability

N73-32922

On the effects of viscous interaction for a flat delta wing at incidence  
[ARC-CP-12371]

N73-32931

Transonic wind tunnel tests to determine effects on flutter of aerodynamic interference between pairs of closely spaced delta wings  
[NASA-CR-23311]

N73-33887

## DEMAND (ECONOMICS)

Demand factors in air transportation marketing

N73-32863

## DIAMONDS

Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators

A73-44294

## DIFFERENTIAL EQUATIONS

The prediction of instabilities of linear differential equations with periodic coefficients  
[ARC-R/M-37131]

N73-33518

## DIFFUSERS

Effect of inlet conditions on optimal shape of diffuser based on theory of potential flow of fluid in channels  
[AD-7655771]

N73-33230

## DIFFUSION WELDING

Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing

A73-43911

## DILUTION

Dispersion and dilution of jet aircraft exhaust at high altitudes  
[NASA-TN-X-714511]

N73-33743

## DIRECT LIFT CONTROLS

Flight control problems of steep approach landing with direct lift control, exemplified by HPB-320 aircraft  
[DGLR-PAPER-73-024]

N73-31965

## DISPERSING

Dispersion and dilution of jet aircraft exhaust at high altitudes  
[NASA-TN-X-714511]

N73-33743

## DISPLAY DEVICES

Display devices for short takeoff aircraft landing  
[DGLR-PAPER-73-038]

N73-31961

Pilot display for monitoring of automatic steep approach  
[DGLR-PAPER-73-031]

N73-31964

Cockpit layouts in view of new landing approach methods  
[HBB-UH-07-73-01]

N73-31966

Flight control display device for producing curved approach profiles in microwave instrument landing systems  
[DGLR-PAPER-73-016]

N73-32526

Electronic display devices in aircraft control, noting pilot activation and VTOL control  
[DLR-MITT-72-041]

N73-32998

Pilot activation in automatic landing by display devices

N73-32999

Extrapolation predictive displays for manual path and position control of VTOL aircraft

N73-33000

Evaluation of large screen display for automated oceanic air traffic control applications  
[FAA-ND-73-751]

N73-33568

Operational evaluation of ARTS 2 radar alphanumeric display subsystem  
[FAA-NA-73-771]

N73-33569

## DISTANCE MEASURING EQUIPMENT

Description of sector-Tacan and DME-supported instrument landing systems  
[DGLR-73-019]

N73-32523

Capacitive method for measuring blade tip clearance in running turbocompressors  
[DLR-FB-72-401]

N73-32628

## DISTORTION

Stability effects of steady state circumferential distortions of inlet total temperature and pressure  
[NASA-TN-X-714311]

N73-32614

## DO-31 AIRCRAFT

DO-31 aircraft integrated flight control system for vertical velocity regulation in gliding, noting signal processing requirements

N73-32983

## DOPPLER EFFECT

Wing tip vortex measurements with laser Doppler velocimeter  
[NASA-CR-1244441]

N73-32924

## DRAG REDUCTION

Aerodynamic drag and lift of airships, noting boundary layer control by suction

N73-32994

## DUCTED FLOW

A difference theory for noise propagation in an acoustically lined duct with mean flow.  
[AIAA PAPER 73-1007]

A73-44840

Theoretical studies of sound emission from aircraft ducts.  
[AIAA PAPER 73-1012]

A73-44844

Finite difference theory of noise propagation in turbofan engine ducts  
[NASA-TN-D-73391]

N73-33744

## DYNAMIC RESPONSE

Dynamic response of short haul aircraft to gust loads  
[POK-K661]

N73-31960

## DYNAMIC STABILITY

Aerothermodynamic study of air cushion vehicles buffeting noting dynamical stability, nonlinear behavior, and similitude law  
[NT-33-19731]

N73-32933

## DYNAMIC STRUCTURAL ANALYSIS

Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers.

A73-A4377

## E

## ECONOMIC ANALYSIS

Air carrier and general aviation airports system planning with emphasis on economic analysis of operation, ownership and finance

[ASME PAPER 73-ICT-33] A73-A43494

Forecast model for predicting economic factors involved in short haul air transportation in California Corridor - Vol. 2

[NASA-CR-114634 (1)] N73-32843

Economic factors, financial management, production and marketing for air transport industry

[NASA-CR-135634] N73-32848

Principles of functional economic analysis

N73-32854

Marketing and cost effectiveness in air transportation economics

N73-32855

Economic efficiency in pricing of air transport services

N73-32856

Competition effects on air transportation industry economics

N73-32858

Economic risk analysis for propeller STOL transport market

N73-32866

Characteristics of Federal regulation of airline operations and predictions for type and extent of future regulation

N73-32894

Analysis of factors affecting future of commercial aircraft development to show effects on overall airline operations

N73-32900

## ECONOMIC FACTORS

Procedure for evaluating relative economic value of technology factors affecting design, configuration, and operation of hypersonic cruise transport

[NASA-CR-2286] N73-31953

Economic market structure of airline industry

N73-32869

Analysis of short-haul air transportation requirements to include aircraft development programs, economic factors, and environmental considerations

N73-32935

Technical and economic aspects of airship transportation

[DLR-MTT-72-17] N73-32989

## ECONOMICS

Airport establishment and operation with emphasis on regional planning, social factors, and economic forces

N73-32877

Analysis of economic factors involved in air cargo operations and air cargo market development

N73-32881

Analysis of factors involved in developing market for air cargo services

N73-32882

Economic evaluation of aircraft and spacecraft

[JPRS-60104] N73-32907

## EIGENVALUES

Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core.

A73-45309

## EJECTION SEATS

Pilot knee ejection clearances for Canadian military aircrafts

[DCIEH-936] N73-31938

Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews

[AGARD-AR-62] N73-31954

## EJECTORS

Static tests of cylindrical ejectors using afterburning turbojet gas generators

[NASA-TM-X-52565] N73-32622

## ELASTIC BARS

Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods

A73-43735

## ELASTIC DEFORMATION

Calculation of the deformations of a propeller blade in flight

A73-43724

## ELECTRIC FIELDS

Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir

[AD-764941] N73-33740

## ELECTRIC POWER SUPPLIES

Fixed installation ground electrical power supply system for aircraft service, discussing motor-alternators, plant control cubicles, selector and busbar switchboxes and fault protection devices

A73-45156

## ELECTRIC SWITCHES

Fixed installation ground electrical power supply system for aircraft service, discussing motor-alternators, plant control cubicles, selector and busbar switchboxes and fault protection devices

A73-45156

## ELECTRIC WIRE

Thermal aging of plastic insulated silver-plated copper aircraft electrical wire

[AD-764731] N73-32135

## ELECTRICAL RESISTIVITY

On the process of precipitation in Mg-Ce alloy.

A73-44155

## ELECTRICITY

Congressional hearings on causes and implications of impending shortages of gasoline, heating oil, diesel fuel, jet fuel, and electricity

N73-33928

## ELECTRON BEAM WELDING

Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing

A73-43911

## ELECTRONIC COUNTERMEASURES

Remotely piloted vehicle /RPV/ for reconnaissance, electronic warfare systems, target acquisition, weapon delivery, air-air combat and different combinations

A73-45399

## ELLIPTICITY

Aerodynamic characteristics of flow around elliptic cones at large angles of attack

[AD-764945] N73-32209

## ENERGY CONVERSION EFFICIENCY

The problem of extrapolating test data on the efficiency of turbine-blade cooling to actual conditions

A73-43741

## ENERGY DISSIPATION

Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods

A73-43735

## ENERGY METHODS

Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method

Application of energy concepts for prediction of pavement system performance

N73-32153

## ENERGY REQUIREMENTS

Use of energy in transportation and implications for future

[P-5025] N73-33921

## ENGINE DESIGN

Acoustic investigation of the engine-over-the-wing concept using a D-shaped nozzle.

[AIAA PAPER 73-1030] A73-44860

Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage

A73-45155

Similarity theory for design optimization of automatic control systems for aircraft gas turbine engines

[AD-764683] N73-32631

- Design and development of quiet, clean propulsion systems for short takeoff aircraft with emphasis on engine noise reduction  
N73-32961
- ENGINE FAILURE**  
Principal failures of turbines during turbine engine operation  
A73-45196
- ENGINE INLETS**  
Inlet geometry and axial Mach number effects on fan noise propagation.  
[AIAA PAPER 73-1022]  
A73-44854  
Computer solutions for potential and viscous flow calculations for engine inlets  
[NASA-TN-X-71457]

Theoretical studies of sound emission from aircraft ducts.  
[AIAA PAPER 73-1012]  
A73-44844
- EXTERNALLY BLOWN FLAPS**  
Mechanisms of externally blown flap noise.  
[AIAA PAPER 73-1029]  
A73-44859  
Takeoff and landing performance characteristics and field length requirements for jet short takeoff transport aircraft with full span, externally blown flaps  
[NASA-TN-D-7441]  
N73-31939

Evaluation of low speed flying qualities of short takeoff aircraft with externally blown flap wing or augmentor wing using flight simulator [NASA-TN-D-7454] N73-31951

Aerodynamic and performance characteristics of short takeoff aircraft equipped with externally blown flaps N73-32939

Wind tunnel tests to determine stability and control characteristics of externally blown jet-flap configurations N73-32940

Wind tunnel tests to determine aerodynamic loads on flap systems behind engines and vibration modes of flap system N73-32945

Measurement of fluctuating surface pressures induced on externally blown flaps by jet impingement and relationship to sonic fatigue of airframes N73-32946

Full-scale ground tests of externally blown flap system on F-111 aircraft wing to determine pressure and temperature distributions on undersurface of wing, vane, and flap N73-32947

Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration N73-32948

Acoustic measurements of aerodynamic noise produced by impingement of jet exhaust on wing and flap of externally blown flap system installed on F-111 aircraft N73-32964

Wind tunnel tests to determine acoustic properties of externally blown flap and augmentor wing for short takeoff aircraft configurations N73-32965

Aerodynamic noise characteristics of short takeoff aircraft with externally blown flaps and engines mounted over and under wing N73-32966

Method for predicting noise generated by deflecting engine exhaust for under-the-wing and over-the-wing versions of externally blown flap configuration [NASA-TN-X-71449] N73-32969

Wind tunnel tests of large scale subsonic jet transport with upper surface blowing flap system for lift augmentation [NASA-TN-X-62296] N73-32973

**EXTRAPOLATION**

Extrapolation predictive displays for manual path and position control of VTOL aircraft N73-33000

**F**

**F-4 AIRCRAFT**

Analysis of flight crew errors contributing to aircraft accidents on F-3 and F-4 aircraft for improved air safety [AD-764868] N73-31979

**F-8 AIRCRAFT**

Transonic wind tunnel tests to determine lift, drag, and stability characteristics of F-8 aircraft model with oblique wing [NASA-TN-X-62273] N73-32974

**F-14 AIRCRAFT**

F-14 replacement for Phantom aircraft for escort missions, fleet defence, interdiction and close support, discussing airborne refuelling capability and composite materials applications A73-44695

Wind tunnel tests to determine low speed characteristics of large scale model of F-14A aircraft with emphasis on high lift configuration stability [NASA-TN-X-62244] N73-31940

**F-100 AIRCRAFT**

Flight tests of modified F-100 aircraft to determine effectiveness of fast-acting flaps as direct-lift-control devices to improve station keeping [NASA-TN-X-2936] N73-32970

**F-104 AIRCRAFT**

Performance tests of hemispherical flow-direction sensor mounted on F-104 aircraft to develop Mach number position error calibration curve [NASA-TN-D-74611] N73-31956

**F-106 AIRCRAFT**

Flight tests of modified F-106 aircraft to determine installation effects of two aft underwing nacelles housing afterburning J-85 engines [NASA-TN-X-71439] N73-31959

**F-111 AIRCRAFT**

Full-scale ground tests of externally blown flap system on F-111 aircraft wing to determine pressure and temperature distributions on undersurface of wing, vane, and flap N73-32947

Acoustic measurements of aerodynamic noise produced by impingement of jet exhaust on wing and flap of externally blown flap system installed on F-111 aircraft N73-32964

**FAIL-SAFE SYSTEMS**

Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure A73-45475

**FAILURE ANALYSIS**

Reliability estimation for repairable and nonrepairable flight vehicles, considering nomographs for failure rate and probability of defined requirements satisfaction A73-45197

**FAILURE MODES**

Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading. A73-43385

Principal failures of turbines during turbine engine operation A73-45196

**FAR FIELDS**

Relationship between distribution of outflow of acoustic energy over jet boundary and far-field intensity [NASA-TN-D-7269] N73-33181

**FATIGUE LIFE**

Improvement of the corrosion-fatigue strength of aluminum alloys by exposure of the medium to a magnetic field A73-43466

Acoustic fatigue resistance of aircraft structures at elevated temperatures. [AIAA PAPER 73-994] A73-44829

Toward reliable composites - An examination of design methodology. A73-45144

Fatigue life tests of ball motion and sliding friction in arched outer race ball bearing under thrust load [NASA-TN-X-71442] N73-32375

**FATIGUE TESTS**

Fatigue crack growth retardation after single-cycle peak overload in Ti-6Al-4V titanium alloy. A73-43809

Environmental effects on fracture resistant and biaxial fatigue design of aircraft structures. A73-43811

**FEEDBACK CONTROL**

Design of multivariable adaptive model following control systems. A73-43288

A study of a fluidic open loop damping flight stability augmentation system. A73-43396

Closed loop linear control system synthesis possibility under condition of incomplete information on state vector with application to aircraft longitudinal motion A73-44329

Feedback control for rotary wing aircraft steep approach profiles [MBB-UFF-1021-0] N73-31967

Nonlinear feedback control concepts for variable stability aircraft N73-32979

**FIGHTER AIRCRAFT**

- Pilot rating of fighter aircraft in precision heading task using mathematical model for predicting aircraft performance  
[AD-760695] N73-31973
- Optimization of control and damping system for fighter aircraft with quadratic cost function  
N73-32980
- VAK 191 B V/STOL fighter aircraft nonlinear feedback flight control system for gliding flight phase  
N73-32984

**FILAMENT WINDING**

- Design requirements and characteristics of toroidal, continuous wound aircraft tire  
[AD-760888] N73-31977

**FINANCIAL MANAGEMENT**

- Air carrier and general aviation airports system planning with emphasis on economic analysis of operation, ownership and finance  
[ASME PAPER 73-ICT-33] A73-43494
- Economic factors, financial management, production and marketing for air transport industry  
[NASA-CR-135634] N73-32848
- Financial sources and airline operations  
N73-32859
- Financial requirements of air transportation industry  
N73-32861
- Bank financing in commercial jet aircraft export  
N73-32862
- Excess capacity in airline industry and operational and financial problems  
N73-32871
- Analysis of air freight rate problems to define roles of Civil Aviation Board and domestic air carriers  
N73-32883

**FINITE DIFFERENCE THEORY**

- A difference theory for noise propagation in an acoustically lined duct with mean flow  
[AIAA PAPER 73-1207] A73-44880
- Finite difference theory of noise propagation in turbofan engine ducts  
[NASA-TN-D-7339] N73-33744

**FINITE ELEMENT METHOD**

- Theoretical studies of sound emission from aircraft ducts  
[AIAA PAPER 73-1212] A73-44844

**PINS**

- The effect of variable environment temperature on heat transfer in extended surfaces.  
A73-43296
- Pressure drop in air flow isothermally across bank of helically wound, L-type fin tubes  
[PB-220315/6] N73-33229

**FLAMMABILITY**

- Research and development projects concerning fire hazards in aircraft cabins and design of aircraft compartments to provide greater passenger survivability  
[FAA-RD-73-146] N73-32972

**FLAPS (CONTROL SURFACES)**

- Evaluation of low speed flying qualities of short takeoff aircraft with externally blown flap wing or augmentor wing using flight simulator  
[NASA-TN-D-7450] N73-31951
- Adjustable airfoil for reversible cowl flap inlet thrust augmentation  
[NASA-CASE-APC-12750-1] N73-32624
- Flight tests of modified P-100 aircraft to determine effectiveness of fast-acting flaps as direct-lift-control devices to improve station keeping  
[NASA-TN-X-2936] N73-32970

**FLAT SURFACES**

- On the effects of viscous interaction for a flat delta wing at incidence  
[APC-CP-1237] N73-32931

**FLEXIBLE BODIES**

- Equations of motion formulated to compute transient response of multi-mass flexible rotors  
[NASA-CR-2300] N73-32374
- Flexible airship manufacturing  
N73-32992

**FLIGHT**

- Dispersion and dilution of jet aircraft exhaust at high altitudes  
[NASA-TN-X-71451] N73-33743

**FLIGHT CHARACTERISTICS**

- Program plan to develop airworthiness standards for STOL aircraft.  
A73-44994

**FLIGHT CONTROL**

- A study of a fluidic open loop damping flight stability augmentation system.  
A73-43396
- On problems of flight over an extended angle-of-attack range.  
A73-44692
- Flight test of structural mode control system installed in XB-70 aircraft to determine effectiveness of system under turbulent conditions  
[NASA-TN-D-7420] N73-31950
- Stability and control characteristics of XB-70 aircraft at airspeeds up to Mach 3.0 and addition of lateral bobweight as auxiliary stabilization device  
[NASA-TN-X-2933] N73-31958
- Flight control for steep approach landing  
[DGLR-PAPER-73-027] N73-31962
- Feedback control for rotary wing aircraft steep approach profiles  
[MBB-UF8-1021-0] N73-31967
- Design, development, and evaluation of automatic departure prevention system and stall inhibitor for A-7 aircraft  
[AD-764767] N73-31972
- Flight control display device for producing curved approach profiles in microwave instrument landing systems  
[DGLR-PAPER-73-016] N73-32526
- Flight simulation to determine manual control of flight path and airspeed for approach and landing of powered lift jet short takeoff aircraft  
N73-32949
- Requirements of flight control systems with regard to aircraft stability and attitude control  
[DLR-MIT-72-05] N73-32978
- Nonlinear feedback control concepts for variable stability aircraft  
N73-32979
- Optimization of control and damping system for fighter aircraft with quadratic cost function  
N73-32980
- Airborne computer role in digital flight control systems, noting systems model, man machine interface, and integration  
N73-32982
- DO-31 aircraft integrated flight control system for vertical velocity regulation in gliding, noting signal processing requirements  
N73-32983
- VAK 191 B V/STOL fighter aircraft nonlinear feedback flight control system for gliding flight phase  
N73-32984
- Design optimization and testing of flight control systems for light helicopters, applied to BO-105 helicopter  
N73-32985
- Effect of artificial longitudinal stability on aircraft performance, based on control configured vehicle concept  
N73-32986
- Effects of artificial aircraft stability control on damping, and static stability recovery by controllers  
N73-32987
- Design of pitching axis control system for aircraft with artificial stability  
N73-32988

**FLIGHT CREWS**

- Analysis of flight crew errors contributing to aircraft accidents on P-3 and P-4 aircraft for improved air safety  
[AD-764868] N73-31979

**FLIGHT HAZARDS**

- Analysis of random motions of vortex elements behind aircraft wing and design of vortex arrays to reduce wake-vortex to small aircraft  
[NASA-TN-X-62304] N73-32976

**FLIGHT OPTIMIZATION**

- Optimal landing flare control of aircrafts with sensitivity consideration.  
A73-43284

## FLIGHT PATHS

- Short haul aircraft operations in terminal area with concurrent conventional aircraft operations to show methods for improved utilization of facilities N73-32953
- Meteorological and weather effects on aircraft landings and flights along air lanes and stratospheric wind effects on supersonic transports [JPRS-62114] N73-33522
- Effect of spatial variability of wind in stratosphere on flight of supersonic transports N73-33529

## FLIGHT SAFETY

- Aviation law development regarding ATC influence on legal liability for aircraft accidents, analyzing controller error influence on liability determination A73-45444
- Flight paths for short takeoff aircraft landing approach consistent with pilot preference passenger comfort, and microwave landing system limitations [NASA-TN-D-7298] N73-31949
- Test data and description of unsymmetrical crash analysis computer program for improved helicopter structural crashworthiness analytical and design techniques - Vol. 2 [AD-764986] N73-31986
- Analysis and simulation of intermittent positive control of air traffic by fully automated ground facility N73-32511
- Restructuring of oceanic air traffic control airspace jurisdictional boundaries in presence of satellite systems [FAA-RD-73-591] N73-33570
- Computer model of Los Angeles, California air traffic control situation to predict conditions expected by 1982 [AD-765153] N73-33571

## FLIGHT SIMULATION

- Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration N73-32948
- Flight simulation to determine manual control of flight path and airspeed for approach and landing of powered lift jet short takeoff aircraft N73-32949
- Flight simulation to determine effectiveness of head-up display for improving glide-slope tracking performance during steep visual approach of short takeoff aircraft N73-32952

## FLIGHT SIMULATORS

- Program plan to develop airworthiness standards for STOL aircraft A73-44994
- Total In-Flight Simulator for X-22A aircraft based on variable stability-and-control system concept for reliability design A73-45153
- Digital computer-generated contact analog landing display [AD-764764] N73-32162
- Characteristics and performance of piloted simulator for application as research tool in design and development of experimental aircraft N73-32955
- Ground-based devices for spatial orientation training in T-38 aircraft [AD-764744] N73-33157

## FLIGHT STABILITY TESTS

- Jet aircraft flight tests for stability derivative determination comparing various measuring techniques [BNVG-FBWT-73-12] N73-31971

## FLIGHT TESTS

- Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings A73-44052
- Management and control of flight test programs of the Western Region FAA A73-44053

- Management and control of flight test programs at U.S. Army Aviation Systems Command. A73-44054
- Management and control of flight test programs of the Naval Air Systems Command. A73-44056
- Management and control of commercial flight test programs. A73-44057
- Management and control of military and commercial flight test programs at Bell Helicopter Company. A73-44058
- Management and control of military flight test programs at McDonnell Douglas St. Louis, Missouri. A73-44059
- Flight test programs management and control, considering weapon systems performance tests relative to contractual requirements, personnel allocation and supporting facilities A73-44060
- Air Force Prototype Program management. A73-44061
- The role of a military flight test engineer in test management. A73-44062
- The capabilities of army test facilities. A73-44064
- Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships A73-44066
- Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel. [AIAA PAPER 73-1047] A73-44871
- Performance tests of hemispherical flow-direction sensor mounted on P-104 aircraft to develop Mach number position error calibration curve [NASA-TN-D-7461] N73-31956
- Flight tests of cryogenically cooled hygrometer [AD-764718] N73-32354
- Evaluation of approach and landing performance of inertial navigation system with Kalman filter installed in CV-340 aircraft [NASA-TN-D-7302] N73-32515
- Flight tests of Boeing 727 aircraft to determine effects of modifications on reduction of aerodynamic noise [FAA-RD-72-46-VOL-3] N73-32971

## FLIGHT VEHICLES

- Reliability estimation for repairable and nonrepairable flight vehicles, considering nomographs for failure rate and probability of defined requirements satisfaction A73-45197

## FLOW CHARACTERISTICS

- Classification of methods for solving the direct problem of axisymmetric flow calculation in turboengines A73-43736
- Measurement of flow parameters in midspan double-circular-arc section of stator in subsonic flow and comparison with computed performance [NASA-TN-D-7425] N73-31932
- Aerodynamic design of inlet stage for two-stage compressor and performance comparison for axial, mixed flow, and centrifugal stage configurations [NASA-CR-120943] N73-32610
- Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability N73-32922
- Effect of inlet conditions on optimal shape of diffuser based on theory of potential flow of fluid in channels [AD-765577] N73-33230
- Characteristics of variable geometry high Mach inlet concepts to reduce jet engine noise on subsonic, long range commercial aircraft [NASA-CR-134495] N73-33748

## FLOW DISTRIBUTION

- Flow field over pointed wedges in isoenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation A73-45547

- Analysis of sonic boom characteristics based on second order solutions for flow distribution around slender bodies in supersonic flow - Part 1 [NASA-CP-2339] N73-31927
- Analysis of inviscid flow field around rectangular wing of finite thickness in supersonic flow N73-32166
- Effect of inlet conditions on optimal shape of diffuser based on theory of potential flow of fluid in channels [AD-765577] N73-33239
- FLOW EQUATIONS**  
On the effects of viscous interaction for a flat delta wing at incidence [ARC-CP-1237] N73-32931
- FLOW GEOMETRY**  
Wind tunnel tests to determine flow distribution at inlet locations on aircraft model for various aerodynamic configurations and airspeeds [NASA-TN-D-7364] N73-31929
- FLOW MEASUREMENT**  
Comparison of results obtained with various sensors used to measure fluctuating quantities in jets [AIAA PAPER 73-1543] A73-44867  
Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet [AIAA PAPER 73-1544] A73-44868  
Measurement of flow parameters in midspan double-circular-arc section of stator in subsonic flow and comparison with computed performance [NASA-TN-D-7225] N73-31932  
Performance tests of hemispherical flow-direction sensor mounted on F-104 aircraft to develop Mach number position error calibration curve [NASA-TN-D-7461] N73-31956  
Development of wind tunnel with self correcting apparatus based on sensors to determine flow conditions on tunnel surfaces and method for varying wall geometry [AD-764957] N73-32161
- FLOW STABILITY**  
Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core. A73-45319
- FLOW THEORY**  
Navier-Stokes equation formulation in parabolic coordinates for flow in trailing vortex, obtaining asymptotic expansions for stream function and angular momentum A73-43205  
Inviscid, isentropic, three-dimensional flow theory for rotating thin blade row in cylindrical duct N73-32193
- FLUID FLOW**  
Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir [AD-764941] N73-33740
- FLUID MECHANICS**  
Fluid mechanics of hole tone whistle designed as efficient producer of discrete frequency sound N73-33170
- FLUIDIC CIRCUITS**  
A study of a fluidic open loop damping flight stability augmentation system. A73-43396
- FLUTTER ANALYSIS**  
Transonic wind tunnel tests to determine effects on flutter of aerodynamic interference between pairs of closely spaced delta wings [NASA-CP-2331] N73-33887
- FLYING PLATFORMS**  
Feasibility study for use of YF-12 aircraft as scientific instrument platform for observing 1970 solar eclipse [NASA-CP-135482] N73-32735
- FOG**  
Determination of visibility slant range when landing aircraft in radiation fog N73-33523
- FORCED VIBRATION**  
Study and calculation of the vibrations of a rotating rotor with allowance for clearances in the bearings A73-43725
- FORECASTING**  
Procedures for conducting air traffic forecasts with emphasis on socio-economic and demographic characteristics of population. N73-32879
- FORGING**  
Hot forging of aluminum alloy structural parts [AD-764618] N73-32384
- FRACTURE MECHANICS**  
Application of reliability analysis to aircraft structures subject to fatigue crack growth and periodic structural inspection [AD-764775] N73-32383
- FRACTURE STRENGTH**  
Environmental effects on fracture resistant and biaxial fatigue design of aircraft structures. A73-43811  
Fracture analysis of surface- and through-cracked sheets and plates. A73-43813  
The effect of composition changes on the fracture toughness of an Al-Zn-Mg-Cu-Mn forging alloy. A73-44025
- FREE FLOW**  
A theoretical and experimental study of sound attenuation in an annular duct. [AIAA PAPER 73-1005] A73-44838
- FREE JETS**  
Comparison of results obtained with various sensors used to measure fluctuating quantities in jets. [AIAA PAPER 73-1043] A73-44867
- FREE VIBRATION**  
Natural, flexural and torsional vibration frequencies and modes for helicopter tail rotor blades A73-45245
- FREIGHT COSTS**  
Analysis of economic factors involved in air cargo operations and air cargo market development N73-32881  
Analysis of factors involved in developing market for air cargo services N73-32882  
Analysis of air freight rate problems to define roles of Civil Aviation Board and domestic air carriers N73-32883  
Research project to determine factors involved in expansion of air freight traffic and prospects for future expansion N73-32884
- FREQUENCY CONVERTERS**  
AC starter generator featuring variable-to-constant frequency conversion by cycloconverters as switching device for use with aircraft engines A73-45154
- FREQUENCY DISTRIBUTION**  
Relative frequency of occurrence of different normal accelerations at the center of gravity of aircraft in turbulence [ARC-R/M-3714] N73-32929
- FUEL COMBUSTION**  
Burning rate studies of fuel air mixtures at high pressures. A73-45162  
Fuel combustion rate and turbulent diffusion induced self ignition in pulsejet engine combustion chamber from schlieren photography and pressure distribution measurements A73-45377  
Incendiary vulnerability of dry bays adjacent to jet fuel tanks under gunfire [AD-764732] N73-32920  
Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir [AD-764941] N73-33740
- FUEL CONSUMPTION**  
Use of energy in transportation and implications for future [P-5025] N73-33921

## FUEL INJECTION

Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer  
A73-45676

## FUEL OILS

Congressional hearings on causes and implications of impending shortages of gasoline, heating oil, diesel fuel, jet fuel, and electricity  
N73-33928

## FUEL TESTS

Burning rate studies of fuel air mixtures at high pressures  
A73-45162

## FUEL-AIR RATIO

Burning rate studies of fuel air mixtures at high pressures  
A73-45162

## FULL SCALE TESTS

Noise comparisons from full-scale fan tests at NASA Lewis Research Center  
[AIAA PAPER 73-1017]  
A73-44849

Low frequency noise generation within aircraft gas turbine engine core portion, discussing sources prediction, model and full scale engine tests, and future technology  
[AIAA PAPER 73-1027]  
A73-44858

A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors  
A73-45264

## G

## GAME THEORY

Game theory mathematical model for optimal control of glide modes in conflict situation  
A73-43263

## GAS FLOW

Universal equations for the laminar boundary layer on a body of revolution in oblique flow  
A73-45529

Flow field over pointed wedges in isoenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation  
A73-45547

## GAS GENERATORS

Static tests of cylindrical ejectors using afterburning turbojet gas generators  
[NASA-TN-X-52565]  
N73-32622

## GAS TEMPERATURE

Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades  
A73-43740

## GAS TURBINE ENGINES

Utilization of semiartificial thermocouples in gas-turbine engine tests  
A73-43743

Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators  
A73-44294

Low frequency noise generation within aircraft gas turbine engine core portion, discussing sources prediction, model and full scale engine tests, and future technology  
[AIAA PAPER 73-1027]  
A73-44858

Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage  
A73-45155

Principal failures of turbines during turbine engine operation  
A73-45196

Effect of inlet air humidity on exhaust gas emissions of nitrogen oxides in gas turbine combustor  
[NASA-TN-D-7396]  
N73-32822

## GAS TURBINES

Thermodynamics of an air-cooled gas-turbine stage  
A73-43733

Designing axial compressor airfoils with camber lines of arbitrary shape  
[AD-765165]  
N73-32636

Emission abatement in aircraft gas turbine combustor with low mass emissions  
[AD-764987]  
N73-32638

Turbojet and turbine engine performance optimization by configuration variations, and auxiliary turbine engine converter problem  
[DLR-MTT-73-05]  
N73-33755

## GASOLINE

Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir  
[AD-764941]  
N73-33744

Congressional hearings on causes and implications of impending shortages of gasoline, heating oil, diesel fuel, jet fuel, and electricity  
N73-33928

## GERMANY

Regional airport planning in Germany  
[DGLR-PAPER-73-035]  
N73-32159

## GLASS

Equipment for removing silver crazing on aircraft glass  
[AD-764972]  
N73-33510

## GLASS FIBER REINFORCED PLASTICS

Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading  
A73-43385

Low-pressure prepregs as structural material for light-construction designs  
A73-44887

## GLIDE PATHS

Game theory mathematical model for optimal control of glide modes in conflict situation  
A73-43263

Cockpit layouts in view of new landing approach methods  
[MBB-UH-07-73-0]  
N73-31966

## GLIDING

VAK 191 B V/STOL fighter aircraft nonlinear feedback flight control system for gliding flight phase  
N73-32984

## GOVERNMENT/INDUSTRY RELATIONS

Management and control of military flight test programs at McDonnell Douglas St. Louis, Missouri  
A73-44059

Air Force Prototype Program management  
A73-44061

The transatlantic charter policy of the United States  
A73-44575

Maplin airport planning history, noise reduction features and government surveys, noting future air traffic trends and planning alternatives  
A73-45373

Development of US commercial air transport industry  
N73-32849

Federal Government participation in development of US air transportation system  
N73-32850

Characteristics of Federal regulation of airline operations and predictions for type and extent of future regulation  
N73-32894

Actions of Civil Aviation Board with respect to monopolies and mergers of domestic airline operations  
N73-32895

Advice and assistance provided by Civil Aviation Board to State Department on matters of international air transportation policy  
N73-32899

Federal policy establishing guidelines for US participation in international air transportation services  
N73-32900

International air transportation policy and application of policy to scheduled and chartered airline services  
N73-32900

## GROUND BASED CONTROL

Numerical analysis of curved approach paths and landing sequence for multiple aircraft using same terminal facilities to provide maximum system performance  
N73-31935

Analysis and simulation of intermittent positive control of air traffic by fully automated ground facility  
N73-32511

- Air traffic control evaluation to determine feasibility of combining smaller aircraft into gaps on flow of normal traffic to increase effectiveness of terminal facilities [FAA-APS-500-11] N73-32517
- Short haul aircraft operations in terminal area with concurrent conventional aircraft operations to show methods for improved utilization of facilities N73-32953
- Development and characteristics of 4-D guidance system for traffic control of STOL aircraft operating in congested areas N73-32957
- Evaluation of large screen display for automated oceanic air traffic control applications [FAA-ND-73-75] N73-33568
- Computer model of Los Angeles, California air traffic control situation to predict conditions expected by 1982 [AD-765153] N73-33571
- GROUND EFFECT**
- Development and characteristics of air cushion landing system for remotely piloted vehicles [AD-764774] N73-31985
- Wind tunnel tests to determine magnitude of adverse ground effects on longitudinal aerodynamic coefficients of powered-lift short takeoff aircraft N73-32950
- GROUND EFFECT MACHINES**
- Thrust augmentation, lift forces, and mixing properties of two-phase flow propulsion and lift system for ground effect machines [AD-765332] N73-32208
- Aerothermodynamic study of air cushion vehicles buffeting noting dynamical stability, nonlinear behavior, and similitude law [NT-33-1973] N73-32933
- GROUND HANDLING**
- Technical aspects of airship manufacture and ground and loading operations N73-32993
- GROUND SUPPORT EQUIPMENT**
- Fixed installation ground electrical power supply system for aircraft service, discussing motor-alternators, plant control cubicles, selector and busbar switchboxes and fault protection devices A73-45156
- GUNFIRE**
- Incendiary vulnerability of dry bays adjacent to jet fuel tanks under gunfire [AD-764732] N73-32920
- GUST LOADS**
- Dynamic response of short haul aircraft to gust loads [POK-K66] N73-31960
- Relative frequency of occurrence of different normal accelerations at the center of gravity of aircraft in turbulence [ARC-R/M-3714] N73-32929
- H**
- HEAD-UP DISPLAYS**
- Flight simulation to determine effectiveness of head-up display for improving glide-slope tracking performance during steep visual approach of short takeoff aircraft N73-32952
- HEAT EXCHANGERS**
- Performance evaluation of model energy separators [AD-764585] N73-32381
- HEAT TRANSFER**
- The problem of extrapolating test data on the efficiency of turbine-blade cooling to actual conditions A73-43741
- HEAT TRANSFER COEFFICIENTS**
- The effect of variable environment temperature on heat transfer in extended surfaces, A73-43296
- HELICOPTER DESIGN**
- Test data and description of unsymmetrical crash analysis computer program for improved helicopter structural crashworthiness analytical and design techniques - Vol. 2 [AD-764986] N73-31986
- HELICOPTER ENGINES**
- Bibliography of technical reports of helicopter engines and rotary wings [AD-764900] N73-31981
- HELICOPTER PERFORMANCE**
- Management and control of military and commercial flight test programs at Bell Helicopter Company, A73-44058
- Bibliography of technical reports of helicopter engines and rotary wings [AD-764900] N73-31981
- HELICOPTER PROPELLER DRIVE**
- Increasing the critical rotational speed of the tail rotor drive shaft in SM-1 and SM-2 helicopters A73-45195
- HELICOPTERS**
- Proceedings of symposium to determine requirements and configurations of emergency ejection systems for helicopter crews [AGARD-AR-62] N73-31954
- Computer program and mathematical model for predicting dynamic response of helicopter in accident involving vertical and lateral impact [AD-764985] N73-32996
- Utilization of decision and value theory concepts by helicopter pilots to plan attacks N73-33565
- HFB-320 AIRCRAFT**
- Flight control problems of steep approach landing with direct lift control, exemplified by HFB-320 aircraft [DGLB-PAPER-73-024] N73-31965
- HIGH ALTITUDE**
- Dispersion and dilution of jet aircraft exhaust at high altitudes [NASA-TN-X-714511] N73-33743
- HIGH STRENGTH ALLOYS**
- The effect of composition changes on the fracture toughness of an Al-Zn-Mg-Cu-Mn forging alloy, A73-44025
- HIGH TEMPERATURE ENVIRONMENTS**
- Acoustic fatigue resistance of aircraft structures at elevated temperatures, [AIAA PAPER 73-994] A73-44829
- HIGH TEMPERATURE GASES**
- Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer A73-45076
- HIGHWAYS**
- The role ground transportation can play in the airport site selection process, [ASME-PAPER 73-ICT-70] A73-43497
- HISTORIES**
- History of Zeppelin airships to show uses for civil and military purposes N73-32590
- HONEYCOMB STRUCTURES**
- Aluminum brazed titanium honeycomb sandwich structure - A new system, A73-44000
- HOT PRESSING**
- Hot forging of aluminum alloy structural parts [AD-764618] N73-32384
- HOT WORKING**
- Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing A73-43911
- HOT-WIRE ANEMOMETERS**
- PDP 8/I data acquisition and averaging program for synchronous hot-wire measurements in mouth of flow excited cavity resonator [AD-764851] N73-32357
- HUMAN FACTORS ENGINEERING**
- Pilot knee ejection clearances for Canadian military aircraft [DCIEM-936] N73-31938
- Analysis of flight crew errors contributing to aircraft accidents on P-3 and P-4 aircraft for improved air safety [AD-764868] N73-31979
- HUMIDITY**
- Effect of inlet air humidity on exhaust gas emissions of nitrogen oxides in gas turbine combustor [NASA-TN-D-7396] N73-32822

## HYDRAULIC CONTROL

Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure  
A73-45475

## HYDROGEN FUELS

Potential of hydrogen fuel for future air transportation systems  
[ASME PAPER 73-ICT-104]  
A73-43499

## HYGROMETERS

Flight tests of cryogenically cooled hygrometer  
[AD-764718]  
N73-32354

## HYPERSONIC AIRCRAFT

Design analysis and fabrication of hypersonic wing test structure  
[NASA CR-127490]  
N73-33883

## HYPERSONIC FLOW

A theoretical and experimental study of sound attenuation in an annular duct  
[AIAA PAPER 73-1305]  
A73-44838  
Hypersonic flow about a spatial body with an attached shock wave  
A73-45172

## HYPERSONIC SPEED

Procedure for evaluating relative economic value of technology factors affecting design, configuration, and operation of hypersonic cruise transport  
[NASA-CR-2286]  
N73-31953

## HYPERSONIC WIND TUNNELS

Hypersonic wind tunnel tests of air breathing engines  
N73-32158

## ICE FORMATION

Acquisition of conditions of icing on modern civil transport aircraft from flight data  
N73-33528

## IGNITION

Fuel combustion rate and turbulent diffusion induced self ignition in pulsejet engine combustion chamber from schlieren photography and pressure distribution measurements  
A73-45377

## IN-FLIGHT MONITORING

Total In-Flight Simulator for X-22A aircraft based on variable stability-and-control system concept for reliability design  
A73-45153

## INCOMPRESSIBLE FLUIDS

Acoustic velocity and sound propagation differences in incompressible and compressible fluids related to Mach cone formation and sonic boom effects  
A73-45269

## INERTIAL NAVIGATION

Evaluation of approach and landing performance of inertial navigation system with Kalman filter installed in CV-340 aircraft  
[NASA-TN-D-7302]  
N73-32515

## INFLATABLE STRUCTURES

Design requirements and characteristics of toroidal, continuous wound aircraft tire  
[AD-754889]  
N73-31977

## INFRARED SPECTRA

Infrared signatures of high performance jet aircraft and evaluation of air to air missile effectiveness  
[SLA-73-5271]  
N73-33929

## INLET FLOW

Emissions from and within an Allison J-33 combustor. II - The effect of inlet air temperature  
A73-43327

Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades  
A73-43740

Wind tunnel tests to determine flow distribution at inlet locations on aircraft model for various aerodynamic configurations and airspeeds  
[NASA-TN-D-7364]  
N73-31929

Flow interference between supersonic intake and airframe to show three dimensional separation of boundary layer  
N73-32194

Aerodynamic design of inlet stage for two-stage compressor and performance comparison for axial, mixed flow, and centrifugal stage configurations  
[NASA-CR-120943]  
N73-32610

Effect of inlet conditions on optimal shape of diffuser based on theory of potential flow of fluid in channels  
[AD-765577]  
N73-33230

Characteristics of variable geometry high Mach inlet concepts to reduce jet engine noise on subsonic, long range commercial aircraft  
[NASA-CR-134495]  
N73-33748

## INLET PRESSURE

Wind tunnel tests to determine flow distribution at inlet locations on aircraft model for various aerodynamic configurations and airspeeds  
[NASA-TN-D-7364]  
N73-31929

Flow interference between supersonic intake and airframe to show three dimensional separation of boundary layer  
N73-32194

## INSTRUMENT APPROACH

Rotary wing aircraft steep instrument approach limits  
[NBB-UD-101-73-01]  
N73-31969

## INSTRUMENT ERRORS

Errors produced by the influence of unsteady heating in strain measurement by wire-type resistance strain gauges  
A73-44292

## INSTRUMENT LANDING SYSTEMS

Radio frequency interference tests of VHF omnirange system, localizer, and glideslope receiving equipment to determine geographical separation requirements - Vol. 2 Book 2  
[FAA-RD-73-1-VOL-2-BK-2]  
N73-32513

Improvement of instrument landing systems with respect to multipath propagation effects and surface reflections  
[DGLR-PAPER-73-017]  
N73-32521

New type of instrument landing systems, according to ICAO requirements  
[DGLR-PAPER-73-011]  
N73-32522

Description of sector-Tacan and DME-supported instrument landing systems  
[DGLR-73-019]  
N73-32523

Compatible ILS, using microwave frequencies, and precision ILS, using antenna arrays, as improved standard instrument landing systems  
[DGLR-PAPER-73-018]  
N73-32524

Effects of transition from conventional to quiet takeoff and landing air traffic, noting introduction of microwave ILS and area navigation  
[NBB-UH-05-73-0]  
N73-32525

Flight control display device for producing curved approach profiles in microwave instrument landing systems  
[DGLR-PAPER-73-016]  
N73-32526

## INSTRUMENTS

Development of instrument to measure steady and oscillatory aerodynamic forces on sting-mounted model using forced oscillation technique  
[ATN-7101]  
N73-33366

## INTAKE SYSTEMS

Theoretical studies of sound emission from aircraft ducts.  
[AIAA PAPER 73-1012]  
A73-44844

Experimental investigation of large scale, two dimensional, mixed compression inlet system  
[NASA-TN-D-7445]  
N73-31928

Effects of blade tip clearance and leading edge sweepback of compressor rotor blades on inducer performance and blade pressure loading  
[NASA-CR-72712]  
N73-31930

Stability effects of steady state circumferential distortions of inlet total temperature and pressure  
[NASA-TN-X-71431]  
N73-32614

Effect of inlet air humidity on exhaust gas emissions of nitrogen oxides in gas turbine combustor  
[NASA-TN-D-7396]  
N73-32822

## INTERNATIONAL COOPERATION

Program plan to develop airworthiness standards for STOL aircraft.  
A73-44994

'Air piracy' and the latest work of ICAO on this subject  
A73-45345

- The development of civil air navigation in the People's Republic of China - Agreements with other states as well as the tasks and the position of the China Civil Aviation Corporation /CAAC/ A73-45386
- Liability and insurance in international air traffic A73-45443
- International civil aviation organization for air traffic forecasting and airport development N73-32865
- Advice and assistance provided by Civil Aviation Board to State Department on matters of international air transportation policy N73-32899
- Aims, prospects, organization, and financing of RUROSAT S.A. N73-33930
- INTERNATIONAL TRADE**

- Characteristics of aerodynamic noise generated by interaction of airstream with flap surface to show location and control of noise sources N73-32963
- JET FLOW**
- Swirling flow effect on jet noise suppression based on acoustic field and engine thrust measurements with and without stationary swirl vanes in exhaust nozzle [AIAA PAPER 73-1043] A73-44836
- A new device for measuring local acoustic power output of subsonic jets, [AIAA PAPER 73-1042] A73-44866
- Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core. A73-45309
- Experimental analysis of nearly isotropic turbulence behind jet grid N73-33174
- Relationship between distribution of outflow of acoustic energy over jet boundary and far-field intensity [NASA-TM-D-7269] N73-33181
- JET IMPINGEMENT**
- Measurement of fluctuating surface pressures induced on externally blown flaps by jet impingement and relationship to sonic fatigue of airframes N73-32946
- JET MIXING FLOW**
- Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet. [AIAA PAPER 73-1044] A73-44863

## JET PUMPS

Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine  
A73-43742

## JP-4 JET FUEL

Physical and chemical properties of JP-4 jet fuel for 1972  
[AD-760697] N73-32605

## K

## KALMAN FILTERS

Evaluation of approach and landing performance of inertial navigation system with Kalman filter installed in CV-340 aircraft  
[NASA-TN-D-73021] N73-32515

## KEROSENE

Electrified kerosene and gasoline aviation fuel during passage through pipes and filters of fuel tank reservoir  
[AD-760941] N73-33740

## KUTTA-JOUKOWSKI CONDITION

Kutta-Joukowski condition for describing three dimensional flow over arbitrary wing  
[PAA-LIB-TRANS-17091] N73-33185

## L

## LAKE'S

Annual variations of Garda lake surface temperature using airborne holometric equipment and earth based infrared video equipment  
[IPA-STP-23] N73-32298

## LAMINAR BOUNDARY LAYER

Universal equations for the laminar boundary layer on a body of revolution in oblique flow  
A73-45529

## LAMINAR FLOW

Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet,  
[AIAA PAPER 73-1544] A73-44868

## LANDING AIDS

Air traffic control evaluation to determine feasibility of combining smaller aircraft into gaps on flow of normal traffic to increase effectiveness of terminal facilities  
[PAA-AFS-500-1] N73-32517

## LANDING GEAR

Design requirements and characteristics of toroidal, continuous wound aircraft tire  
[AD-760889] N73-31977  
Development and characteristics of air cushion landing system for remotely piloted vehicles  
[AD-760773] N73-31985

## LANDING LOADS

Airport runway and taxiway surfaces modifications for heavy and supersonic aircraft demonstrated by aircraft static and dynamic landing loads and physical dimensions  
A73-45199

## LASERS

Wing tip vortex measurements with laser Doppler velocimeter  
[NASA-CF-120000] N73-32924

## LATERAL STABILITY

Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability  
N73-32922

## LAW (JURISPRUDENCE)

Aviation law development regarding ATC influence on legal liability for aircraft accidents, analyzing controller error influence on liability determination  
A73-45444  
Actions of Civil Aviation Board with respect to monopolies and mergers of domestic airline operations  
N73-32895

## LEADING EDGE SLATS

Mechanisms of externally blown flap noise  
[AIAA PAPER 73-1291] A73-44859  
Aerodynamic forces, pressure distribution, and wakes of wing profile with trailing edge flaps and leading edge slats  
N73-33187

## LEGAL LIABILITY

Liability and insurance in international air traffic  
A73-45443

Aviation law development regarding ATC influence on legal liability for aircraft accidents, analyzing controller error influence on liability determination  
A73-45444

## LIFT

On the application of a new version of lifting surface theory to nonslender and kinked wings.  
A73-43210

Airfoil theory calculation of bent thin foil lift coefficient and longitudinal moment characteristics at arbitrary flow separation point location  
A73-43720

The effect of walls on the lifting force of a solid-foil wing  
A73-43722

## LIFT AUGMENTATION

On problems of flight over an extended angle-of-attack range.  
A73-44692

Evaluation of low speed flying qualities of short takeoff aircraft with externally blown flap wing or augmentor wing using flight simulator  
[NASA-TN-D-7454] N73-31951

Thrust augmentation, lift forces, and mixing properties of two-phase flow propulsion and lift system for ground effect machines  
[AD-765332] N73-32208

Aerodynamic and performance characteristics of short takeoff aircraft equipped with externally blown flaps  
N73-32939

Wind tunnel tests to determine basic performance of swept augmentor wing configuration and effect on longitudinal characteristics of aircraft  
N73-32941

Aerodynamic characteristics of augmentor wings and analysis of augmentation and entrainment in defining a net thrust coefficient  
N73-32942

Wind tunnel tests to determine aerodynamic characteristics of upper surface blown jet-flap concept incorporating high-bypass-ratio turbofan engines  
N73-32943

Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration  
N73-32948

Flight tests of augmentor-wing jet STOL research aircraft to compare wind tunnel data with flight data for dynamic characteristics and limitations  
N73-32954

Wind tunnel tests of large scale subsonic jet transport with upper surface blowing flap system for lift augmentation  
[NASA-TM-X-62296] N73-32973

## LIFT DEVICES

Short takeoff and landing /STOL/ aircraft technology developments for high density air transport, discussing lift system, handling, airfoil design, acoustics and operating economics  
A73-43520

Flight tests of modified P-100 aircraft to determine effectiveness of fast-acting flaps as direct-lift-control devices to improve station keeping  
[NASA-TM-X-2936] N73-32970

## LIFT FANS

Wind tunnel tests to determine acoustic properties of large scale lift fan transport aircraft model  
[NASA-TM-X-62284] N73-32975

## LIGHT AIRCRAFT

Air traffic control evaluation to determine feasibility of combining smaller aircraft into gaps on flow of normal traffic to increase effectiveness of terminal facilities  
[PAA-AFS-500-1] N73-32517

## LINEAR EQUATIONS

The prediction of instabilities of linear differential equations with periodic coefficients  
[APC-R/M-3713] N73-33518

## LINEAR SYSTEMS

Closed loop linear control system synthesis possibility under condition of incomplete information on state vector with application to aircraft longitudinal motion

A73-44329

## LIQUID HYDROGEN

Potential of hydrogen fuel for future air transportation systems.  
[ASME PAPER 73-ICT-104]

A73-43499

## LOADING OPERATIONS

Technical aspects of airship manufacture and ground and loading operations

N73-32993

## LOADING RATE

Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading.

A73-43385

## LOGISTICS MANAGEMENT

The capabilities of army test facilities.

A73-44064

## LONGITUDE

Meridional distribution of tropospheric ozone from measurements aboard commercial airliners.

A73-43859

## LONGITUDINAL STABILITY

Airfoil theory calculation of bent thin foil lift coefficient and longitudinal moment characteristics at arbitrary flow separation point location

A73-43720

Longitudinal stability of Boeing 707 aircraft during steep approach, for noise reduction  
[DGLR-PAPER-73-023]

N73-31963

Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability

N73-32922

Wind tunnel tests to determine basic performance of swept augmentor wing configuration and effect on longitudinal characteristics of aircraft

N73-32941

Wind tunnel tests to determine magnitude of adverse ground effects on longitudinal aerodynamic coefficients of powered-lift short takeoff aircraft

N73-32950

Effect of artificial longitudinal stability on aircraft performance, based on control configured vehicle concept

N73-32986

## LOW ASPECT RATIO WINGS

Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method

A73-43723

Approximate calculation of the cavitation flow past low-aspect-ratio wings

A73-45540

## LOW VISIBILITY

Aircraft landing problems under low visibility weather conditions  
[DGLR-PAPER-73-015]

N73-32520

## LUBRICATION SYSTEMS

Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine

A73-43742

## M

## MACH CONES

Acoustic velocity and sound propagation differences in incompressible and compressible fluids related to Mach cone formation and sonic boom effects

A73-45269

## MACH NUMBER

Inlet geometry and axial Mach number effects on fan noise propagation  
[AIAA PAPER 73-1022]

A73-44854

## MAGNESIUM ALLOYS

On the process of precipitation in Mg-Ce alloy.

A73-44155

## MAGNETIC EFFECTS

Improvement of the corrosion-fatigue strength of aluminum alloys by exposure of the medium to a magnetic field

A73-43866

## MAN MACHINE SYSTEMS

Airborne computer role in digital flight control systems, noting systems model, man machine interface, and integration

N73-32982

## MANAGEMENT

Aims, prospects, organization, and financing of EUROSAT S.A.

N73-33930

## MANAGEMENT METHODS

Management and control of military and commercial flight test programs at Bell Helicopter Company.

A73-44158

## MANAGEMENT PLANNING

Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings.

A73-44052

Management of Air Force test and evaluation activities.

A73-44055

Management and control of flight test programs of the Naval Air Systems Command.

A73-44056

Economics, traffic demand, and community acceptance of short haul air transportation system in California Corridor - Vol. 1  
[NASA-CR-114634]

N73-32842

Procedures for conducting air traffic forecasts with emphasis on socio-economic and demographic characteristics of population

N73-32879

## MANEUVERABILITY

Technical conditions for airship development, noting weight reduction, propulsion system performance, and maneuverability improvement

N73-32995

## MANUFACTURING

Flexible airship manufacturing

N73-32992

Technical aspects of airship manufacture and ground and loading operations

N73-32993

## MARKET RESEARCH

Concepts of expanding airline marketing strategies

N73-32870

## MARKETING

Economic factors, financial management, production and marketing for air transport industry  
[NASA-CR-135634]

N73-32848

Marketing and cost effectiveness in air transportation economics

N73-32855

Economic efficiency in pricing of air transport services

N73-32856

Differential pricing policy in airline operations

N73-32857

Demand factors in air transportation marketing

N73-32863

Economic risk analysis for propeller STOL transport market

N73-32866

Economic market structure of airline industry

N73-32869

Consumer marketing for airline industry

N73-32873

## MATERIALS HANDLING

Flexible airship manufacturing

N73-32992

## MATERIALS SCIENCE

Low-pressure prepreqs as structural material for light-construction designs

A73-44887

## MATHEMATICAL MODELS

Game theory mathematical model for optimal control of glide modes in conflict situation

A73-43263

Design of multivariable adaptive model following control systems.

A73-43258

Classification of methods for solving the direct problem of axisymmetric flow calculation in turboengines

A73-43736

Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel

A73-44702

- Supersonic jet noise generated by large scale disturbances  
[AIAA PAPER 73-992] A73-44827
- Mathematical model for real time simulation of tilt rotor aircraft to evaluate aircraft performance and handling qualities  
[NASA-CR-114611] N73-31947
- Airborne computer role in digital flight control systems, noting systems model, man machine interface, and integration  
N73-32982
- MCDONNELL DOUGLAS AIRCRAFT**  
Management and control of military flight test programs at McDonnell Douglas St. Louis, Missouri.  
A73-44059
- MEASURING INSTRUMENTS**  
Comparison of results obtained with various sensors used to measure fluctuating quantities in jets.  
[AIAA PAPER 73-1043] A73-44867
- Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet  
[AIAA PAPER 73-1044] A73-44868
- MECHANICAL DEVICES**  
Development of mechanical equipment reliability prediction techniques  
[AD-765367] N73-32390
- MECHANICAL DRIVES**  
Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine  
A73-43742
- MECHANICAL PROPERTIES**  
Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading.  
A73-43385
- METAL FATIGUE**  
Improvement of the corrosion-fatigue strength of aluminum alloys by exposure of the medium to a magnetic field  
A73-43466
- Fracture analysis of surface and through-cracked sheets and plates.  
A73-43813
- METEOROLOGICAL PARAMETERS**  
Meteorological and weather effects on aircraft landings and flights along air lanes and stratospheric wind effects on supersonic transports  
[JPES 6-114] N73-33522
- MICROPHONES**  
A new device for measuring local acoustic power output of subsonic jets.  
[AIAA PAPER 73-1042] A73-44866
- MIDAIR COLLISIONS**  
US government and industry efforts on aircraft midair collision avoidance systems technology advancement, comparing cost effectiveness between airborne and ground based options  
[ASME PAPER 73-ICT-49] A73-43495
- MILITARY AIRCRAFT**  
The capabilities of army test facilities.  
A73-44064
- Pilot knee ejection clearances for Canadian military aircrafts  
[DCIEM-936] N73-31938
- MILITARY HELICOPTERS**  
Test data and description of unsymmetrical crash analysis computer program for improved helicopter structural crashworthiness analytical and design techniques - Vol. 2  
[AD-764986] N73-31986
- Systems analysis of avionics and aircraft equipment for search and rescue helicopters to determine cost effective improvements - Vol. 7  
[AD-764914] N73-33381
- MILITARY TECHNOLOGY**  
The role of a military flight test engineer in test management  
A73-44062
- Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships  
A73-44066
- Advances in technology and armament in USSR  
[AD-763323] N73-32917
- Utilization of decision and value theory concepts by helicopter pilots to plan attacks  
N73-33565
- MISSION PLANNING**  
Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135903] N73-33919
- Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135902] N73-33920
- MOMENTUM TRANSFER**  
Determination of the impulses and moments imparted by shock waves to bodies of revolution  
A73-45542
- MONITORS**  
Pilot display for monitoring of automatic steep approach  
[DGLR-PAPER-73-031] N73-31964
- MOUNTAINS**  
Atmospheric turbulence near tropopause over mountainous terrain  
N73-33525
- MULTIPATH TRANSMISSION**  
Improvement of instrument landing systems with respect to multipath propagation effects and surface reflections  
[DGLR-PAPER-73-C17] N73-32521
- N**
- NACELLES**  
Flight tests of modified F-106 aircraft to determine installation effects of two aft underwing nacelles housing afterburning J-85 engines  
[NASA-TM-X-71439] N73-31959
- NATIONAL AIRSPACE UTILIZATION SYSTEM**  
Performance and environmental tests of National Air Space Enroute Stage air traffic control system  
[FAA-NA-73-55] N73-32518
- NATIONAL AVIATION SYSTEM**  
Organization, responsibilities, and functions of Civil Aeronautics Board in determining award of air routes to air lines  
N73-32880
- NAVIER-STOKES EQUATION**  
Navier-Stokes equation formulation in parabolic coordinates for flow in trailing vortex, obtaining asymptotic expansions for stream function and angular momentum  
A73-43205
- NAVIGATION SATELLITES**  
Restructuring of oceanic air traffic control airspace jurisdictional boundaries in presence of satellite system  
[FAA-RD-73-59] N73-33570
- NAVY**  
Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships  
A73-44066
- NEUTRON IRRADIATION**  
Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators  
A73-44294
- NIGHT VISION**  
Systems analysis of avionics and aircraft equipment for search and rescue helicopters to determine cost effective improvements - Vol. 7  
[AD-764914] N73-33381
- NITROGEN OXIDES**  
Effect of inlet air humidity on exhaust gas emissions of nitrogen oxides in gas turbine combustor  
[NASA-TN-D-7396] N73-32822
- NOISE GENERATORS**  
Supersonic jet noise generated by large scale disturbances.  
[AIAA PAPER 73-992] A73-44827
- Broadband noise generation by aerofoils and axial flow fans.  
[AIAA PAPER 73-1018] A73-44850
- Multiple pure tone noise generation and control.  
[AIAA PAPER 73-1021] A73-44853
- Noise generation by turbulent combustion, discussing sound power, spectral content, enclosure effect, and importance in turbopropulsion system core engine noise  
[AIAA PAPER 73-1023] A73-44855

- Spectral trends in rotor noise generation.  
[AIAA PAPER 73-1033] A73-44862
- NOISE INTENSITY**
- Calculation procedures for predicting noise-time histories and noise contours for various types of aircraft  
[NASA-CR-114649] N73-31945
- Analysis of jet engine noise to show sources of noise, noise spectra, and use of laminates and composite materials for noise reduction  
N73-32962
- NOISE METERS**
- A new device for measuring local acoustic power output of subsonic jets.  
[AIAA PAPER 73-10421] A73-44866
- NOISE PROPAGATION**
- A difference theory for noise propagation in an acoustically lined duct with mean flow.  
[AIAA PAPER 73-10071] A73-44849
- Inlet geometry and axial Mach number effects on fan noise propagation  
[AIAA PAPER 73-10221] A73-44854
- Finite difference theory of noise propagation in turbofan engine ducts  
[NASA-TN-D-73391] N73-33744
- NOISE REDUCTION**
- Subsonic and supersonic jets and supersonic suppressor characteristics.  
[AIAA PAPER 73-9991] A73-44834
- Swirling flow effect on jet noise suppression based on acoustic field and engine thrust measurements with and without stationary swirl vanes in exhaust nozzle  
[AIAA PAPER 73-10031] A73-44836
- The influence of aerodynamic flow noise in turbofan engines  
[AIAA PAPER 73-10161] A73-44848
- Multiple pure tone noise generation and control.  
[AIAA PAPER 73-10211] A73-44853
- Progress in source noise suppression of subsonic tip speed fans.  
[AIAA PAPER 73-10321] A73-44861
- A study to determine the feasibility of a low sonic boom supersonic transport  
[AIAA PAPER 73-10351] A73-44863
- Maplin airport planning history, noise reduction features and government surveys, noting future air traffic trends and planning alternatives  
A73-45373
- Aircraft noise reduction alternatives for operational aircraft, noting noise generation upstream of final nozzle, reengining, refanning and suppressor techniques  
A73-45374
- Far field noise reduction of tilting rotor aircraft based on performance and weight tradeoffs to improve acoustic signatures  
[NASA-CR-114608] N73-31937
- Theory for predicting sonic boom intensity and techniques for sonic boom suppression  
[FAA-PD-73-41] N73-31944

[NASA-TN-X-714501] N73-33179
- Fan and core engine noise suppression for STOL aircraft  
[NASA-TN-X-714481] N73-33741
- NOISE SPECTRA**
- Noise comparisons from full-scale fan tests at NASA Lewis Research Center.  
[AIAA PAPER 73-10171] A73-44849
- Low frequency noise generation within aircraft gas turbine engine core portion, discussing sources prediction, model and full scale engine tests, and future technology  
[AIAA PAPER 73-10271] A73-44858
- Mechanisms of externally blown flap noise.  
[AIAA PAPER 73-10291] A73-44859
- Progress in source noise suppression of subsonic tip speed fans.  
[AIAA PAPER 73-10321] A73-44861
- Spectral trends in rotor noise generation.  
[AIAA PAPER 73-10331] A73-44862
- Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel.  
[AIAA PAPER 73-10471] A73-44871
- A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors.  
A73-45264
- NOMOGRAPHS**
- Reliability estimation for repairable and nonrepairable flight vehicles, considering nomographs for failure rate and probability of defined requirements satisfaction  
A73-45197
- NONDESTRUCTIVE TESTS**
- Test results and evaluation procedure for nondestructive tests of airfield pavements  
[AD-7647871] N73-32382
- Application of radiation technology and equipment for nondestructive analysis of commercial aircraft structures during aircraft maintenance periods  
N73-33579
- NONLINEAR FEEDBACK**
- Nonlinear feedback control concepts for variable stability aircraft  
N73-32979
- NONLINEAR SYSTEMS**
- Aerothermodynamic study of air cushion vehicles buffeting noting dynamical stability, nonlinear behavior, and similitude law  
[NT-33-19731] N73-32933
- NONSYNCHRONIZATION**
- Air traffic control radar beacon system interference in terminal areas  
[MTR-62391] N73-32512
- NONUNIFORM FLOW**
- Flow field over pointed wedges in isoenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation  
A73-45547
- NOZZLE DESIGN**
- Acoustic investigation of the engine-over-the-wing concept using a D-shaped nozzle.  
[AIAA PAPER 73-10301] A73-44860
- NOZZLE GEOMETRY**
- Nozzle geometry and forward velocity effects on noise for CTOL engine-over-wing concept  
[NASA-TN-X-714531] N73-33742
- ODORS**
- Sensory odor tests of exhaust from turbojet engine combustor operating at simulated idle conditions  
[NASA-TN-X-714291] N73-32613
- ONE DIMENSIONAL FLOW**
- Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel  
A73-44702
- OPERATIONS RESEARCH**
- Functional models for airline operations  
N73-32870

Research project to determine factors involved in expansion of air freight traffic and prospects for future expansion  
N73-32880

Analysis of commuter air transportation services to define problems and identify methods for improvements in cost effective operations  
N73-32885

Evaluation of new forms of air transport service for improving short haul air travel market  
N73-32887

Actions by Civil Aviation Board to regulate and improve commuter air transportation services  
N73-32888

**OPTIMAL CONTROL**

Game theory mathematical model for optimal control of glide modes in conflict situation  
A73-43263

Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973.  
A73-43277

Optimal landing flare control of aircrafts with sensitivity consideration  
A73-43280

**OPTIMIZATION**

Similitude theory for design optimization of automatic control systems for aircraft gas turbine engines  
N73-32631

Optimization of control and damping system for fighter aircraft with quadratic cost function  
N73-32980

Design optimization and testing of flight control systems for light helicopters, applied to BO-105 helicopter  
N73-32985

**OVERPRESSURE**

A study to determine the feasibility of a low sonic boom supersonic transport.  
[AIAA PAPER 73-1035]  
A73-44863

**OXIDIZERS**

Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer  
A73-45076

**OZONE**

Meridional distribution of tropospheric ozone from measurements aboard commercial airliners.  
A73-43859

**P**

**P-3 AIRCRAFT**

Analysis of flight crew errors contributing to aircraft accidents on P-3 and F-4 aircraft for improved air safety  
[AD-764868]  
N73-31979

**PARACHUTE DESCENT**

Computer program for analyzing characteristics of parachute-payload system during deployment and trajectory  
N73-31936

**PASSENGER AIRCRAFT**

Analysis of commuter air transportation services to define problems and identify methods for improvements in cost effective operations  
N73-32885

Operation of low cost local air service carriers to show methods for improving transportation services  
N73-32886

Actions by Civil Aviation Board to regulate and improve commuter air transportation services  
N73-32888

**PASSENGERS**

Analytical forecasting methods for air passenger traffic  
N73-32860

**PAVEMENTS**

Application of energy concepts for prediction of pavement system performance  
N73-32153

Test results and evaluation procedure for nondestructive tests of airfield pavements  
[AD-764787]  
N73-32382

**PERFORMANCE PREDICTION**

Some comments to mathematical interpretation of performance characteristics of jet engine combustion chambers.  
A73-45381

Pilot rating of fighter aircraft in precision heading task using mathematical model for predicting aircraft performance  
[AD-764695]  
N73-31973

Computer program for predicting pilot rating of pitch stability of T-33 aircraft under vertical turbulence conditions  
[AD-764696]  
N73-31974

Application of energy concepts for prediction of pavement system performance  
N73-32153

Development of mechanical equipment reliability prediction techniques  
[AD-765367]  
N73-32390

Design parameters for optimal cost/cruise performance of subsonic jet transport  
N73-32853

International civil aviation organization for air traffic forecasting and airport development  
N73-32865

Functional models for airline operations  
N73-32870

**PERFORMANCE TESTS**

The effects of modulated blade spacing on static rotor acoustics and performance.  
[AIAA PAPER 73-1020]  
A73-44852

A new device for measuring local acoustic power output of subsonic jets.  
[AIAA PAPER 73-1042]  
A73-44866

Effects of blade tip clearance and leading edge sweepback of compressor rotor blades on inducer performance and blade pressure loading  
[NASA-CR-72712]  
N73-31930

Performance and environmental tests of National Air Space Enroute Stage air traffic control system  
[FAA-NA-73-55]  
N73-32518

Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135903]  
N73-33919

Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135902]  
N73-33920

**PERIODIC FUNCTIONS**

The prediction of instabilities of linear differential equations with periodic coefficients  
[ARC-R/M-3713]  
N73-33518

**PERSONNEL MANAGEMENT**

Flight test programs management and control, considering weapon systems performance tests relative to contractual requirements, personnel allocation and supporting facilities  
A73-44060

The capabilities of army test facilities  
A73-44064

**PHASE VELOCITY**

Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core.  
A73-45309

**PILOT PERFORMANCE**

Computer program for predicting pilot rating of pitch stability of T-33 aircraft under vertical turbulence conditions  
[AD-764696]  
N73-31974

Flight simulation to determine effectiveness of head-up display for improving glide-slope tracking performance during steep visual approach of short takeoff aircraft  
N73-32052

Electronic display devices in aircraft control, noting pilot activation and VTOL control  
[DLR-MITT-72-04]  
N73-32998

Pilot activation in automatic landing by display devices  
N73-32999

Utilization of decision and value theory concepts by helicopter pilots to plan attacks  
N73-33565

**PITCH**

Multiple pure tone noise generation and control.  
[AIAA PAPER 73-1021]  
A73-44853

**PITCHING MOMENTS**

- Slotted transonic wind tunnel tests on pitching  
delta wing enable selection of porous walls for  
interference free damping derivatives  
[ARC-R/M-3715] N73-32930
- Design of pitching axis control system for  
aircraft with artificial stability N73-32988

**PLASTIC AIRCRAFT STRUCTURES**

- Low-pressure prepregs as structural material for  
light-construction designs A73-88887

**PLASTIC DEFORMATION**

- Designing a slender-wing-type cantilever plate  
under conditions of unsteady creep A73-43728

**PNEUMATIC EQUIPMENT**

- Development and characteristics of air cushion  
landing system for remotely piloted vehicles  
[AD-768774] N73-31985

**POLICIES**

- The transatlantic charter policy of the United States  
A73-44575
- International air transportation policy and  
application of policy to scheduled and chartered  
airline services N73-32903

**POROUS WALLS**

- Slotted transonic wind tunnel tests on pitching  
delta wing enable selection of porous walls for  
interference free damping derivatives  
[ARC-R/M-3715] N73-32930

**POTENTIAL FLOW**

- Computer solutions for potential and viscous flow  
calculations for engine inlets  
[NASA-TN-X-71857] N73-33184

**POWER SPECTRA**

- Noise generation by turbulent combustion,  
discussing sound power, spectral content,  
enclosure effect, and importance in  
turbo-propulsion system core engine noise  
[AIAA PAPER 73-1023] A73-48855

**PRECIPITATION (CHEMISTRY)**

- On the process of precipitation in Mg-Ce alloy.  
A73-44155

**PREDICTION ANALYSIS TECHNIQUES**

- Theoretical studies of sound emission from  
aircraft ducts  
[AIAA PAPER 73-1012] A73-48844
- Analytical forecasting methods for air passenger  
traffic N73-32864
- Method for predicting noise generated by  
deflecting engine exhaust for under-the-wing and  
over-the-wing versions of externally blown flap  
configuration  
[NASA-TN-X-71891] N73-32969
- Computer program and mathematical model for  
predicting dynamic response of helicopter in  
accident involving vertical and lateral impact  
[AD-764985] N73-32996

**PREIMPREGNATION**

- Low-pressure prepregs as structural material for  
light-construction designs A73-48887

**PRESSURE DISTRIBUTION**

- Total pressure loss distribution in viscous gas  
flow through annular cascades of axial flow  
compressors, examining three dimensional flow  
effects on boundary layer development A73-44916
- Some results from tests in the NAE high Reynolds  
number two-dimensional test facility on  
shockless and other airfoils A73-44995
- Effects of blade tip clearance and leading edge  
sweepback of compressor rotor blades on inducer  
performance and blade pressure loading  
[NASA-CR-72712] N73-31930
- Wind tunnel tests to determine aerodynamic loads  
on flap systems behind engines and vibration  
modes of flap system N73-32945
- Measurement of fluctuating surface pressures  
induced on externally blown flaps by jet  
impingement and relationship to sonic fatigue of  
airframes N73-32946

- Full-scale ground tests of externally blown flap  
system on F-111 aircraft wing to determine  
pressure and temperature distributions on  
undersurface of wing, vane, and flap N73-32947

- Relationship between distribution of outflow of  
acoustic energy over jet boundary and far-field  
intensity  
[NASA-TN-D-7269] N73-33181

**PRESSURE DROP**

- Total pressure loss distribution in viscous gas  
flow through annular cascades of axial flow  
compressors, examining three dimensional flow  
effects on boundary layer development A73-44916

**PRESSURE EFFECTS**

- Burning rate studies of fuel air mixtures at high  
pressures. A73-45162
- Measurement of fluctuating surface pressures  
induced on externally blown flaps by jet  
impingement and relationship to sonic fatigue of  
airframes N73-32946

**PRESSURE PULSES**

- Emission of sound from a rectangular plate  
vibrating under the action of pressure  
pulsations in a turbulent boundary layer A73-44899

**PRESSURE RECOVERY**

- Experimental investigation of large scale, two  
dimensional, mixed compression inlet system  
[NASA-TN-D-7445] N73-31928

**PRESSURE REDUCTION**

- Pressure drop in air flow isothermally across bank  
of helically wound, L-type fin tubes  
[PB-220315/6] N73-33229

**PROBABILITY THEORY**

- Reliability estimation for repairable and  
nonrepairable flight vehicles, considering  
nomographs for failure rate and probability of  
defined requirements satisfaction A73-45197

**PRODUCTION ENGINEERING**

- Economic factors, financial management, production  
and marketing for air transport industry  
[NASA-CR-135634] N73-32848
- Production forecasting for aircraft manufacturer  
N73-32872

**PRODUCTION MANAGEMENT**

- Management and control of flight test programs of  
the Western Region FAA. A73-44053

**PRODUCTION PLANNING**

- Management and control of commercial flight test  
programs. A73-44057
- Technological change measurement methodology for  
cost and production estimates with application  
to aircraft turbine engine development A73-44219

**PROJECT MANAGEMENT**

- Society of Flight Test Engineers, National  
Symposium, 3rd, Arlington, Tex., September  
11-14, 1972, Proceedings. A73-44052
- Management and control of flight test programs of  
the Western Region FAA. A73-44053
- Management and control of flight test programs at  
U.S. Army Aviation Systems Command. A73-44054
- Management and control of commercial flight test  
programs. A73-44057
- Air Force Prototype Program management. A73-44061
- The role of a military flight test engineer in  
test management. A73-44062

**PROJECT PLANNING**

- Management and control of flight test programs of  
the Naval Air Systems Command. A73-44056
- Management and control of military and commercial  
flight test programs at Bell Helicopter Company.  
A73-44058

Flight test programs management and control, considering weapon systems performance tests relative to contractual requirements, personnel allocation and supporting facilities A73-44060

**PROPELLER BLADES**  
Calculation of the deformations of a propeller blade in flight A73-43724  
Spectral trends in rotor noise generation [AIAA PAPER 73-1033] A73-44862  
Natural, flexural and torsional vibration frequencies and modes for helicopter tail rotor blades A73-45245

**PROPULSION SYSTEM CONFIGURATIONS**  
Design and development of quiet, clean propulsion systems for short takeoff aircraft with emphasis on engine noise reduction N73-32961  
Selection criteria and characteristics of quiet, clean propulsion systems for use with short takeoff aircraft N73-32967  
Turbojet and turbine engine performance optimization by configuration variations, and auxiliary turbine engine converter problem [DLR-MIT-73-05] N73-33755  
Influence of combustion chamber, compressor, and afterburner configuration on static performance of two-cycle turbojet engines with high bypass ratio N73-33756

**PROPULSION SYSTEM PERFORMANCE**  
Potential of hydrogen fuel for future air transportation systems, [ASME PAPER 73-ICT-104] A73-43499  
Technical conditions for airship development, noting weight reduction, propulsion system performance, and maneuverability improvement N73-32995  
Turbojet and turbine engine performance optimization by configuration variations, and auxiliary turbine engine converter problem [DLR-MIT-73-05] N73-33755  
Performance of two-cycle turbojet engine for multi-parameter control under influence of jet vane and fuel throughput variations N73-33757

**PROTOTYPES**  
Air Force Prototype Program management, A73-44061

**PULSE COMMUNICATION**  
Applications of spread spectrum communications techniques to avionics systems N73-32058

**PULSEJET ENGINES**  
Fuel combustion rate and turbulent diffusion induced self ignition in pulsejet engine combustion chamber from schlieren photography and pressure distribution measurements A73-45377

**PUMP IMPELLERS**  
Synchronized operation of a positive-displacement gear pump and a vane pump within the lubricant oil delivery system of a jet engine A73-43742

## R

**RADAR ANTENNAS**  
Dielectric lightweight aircraft radar antenna array [AD-764685] N73-32131

**RADAR BEACONS**  
Air traffic control radar beacon system interference in terminal areas [MTR-6239] N73-32512  
Evaluation of air traffic control beacon alphanumeric system for automatic operation in low density airport towers and terminal facilities [FAA-NA-73-54] N73-32516

**RADAR EQUIPMENT**  
Operational evaluation of ARTS 2 radar alphanumeric display subsystem [FAA-NA-73-77] N73-33569

**RADIO FREQUENCY INTERFERENCE**  
Radio frequency interference tests of VHF omnirange system, localizer, and glideslope receiving equipment to determine geographical separation requirements - Vol. 2 Book 2 [FAA-RD-73-1-VOL-2-BK-2] N73-32513

**RADIO NAVIGATION**  
Radio frequency interference tests of VHF omnirange system, localizer, and glideslope receiving equipment to determine geographical separation requirements - Vol. 2 Book 2 [FAA-RD-73-1-VOL-2-BK-2] N73-32513

**RADIOGRAPHY**  
Application of radiation technology and equipment for nondestructive analysis of commercial aircraft structures during aircraft maintenance periods N73-33579

**RAMS (PUMPS)**  
Ram air turbine with hydraulic pitch change, servo regulated speed as emergency power source for aircraft control in event of main engine failure A73-45475

**RAPID TRANSIT SYSTEMS**  
The role ground transportation can play in the airport site selection process. [ASME PAPER 73-ICT-70] A73-43497

**RAREFIED GASES**  
Analysis of aerodynamic drag on object moving in rarefied gas under nearly free molecular flow conditions N73-32923

**REAL TIME OPERATION**  
Dual lane runway configuration design and operational characteristics investigation by real time computer simulation for solution to airport capacity problem [ASME PAPER 73-ICT-61] A73-43496

**RECTANGULAR PLANFORMS**  
Wake development on models of elliptic, rectangular, swept and delta planforms when plunged in water [ARC-CP-1238] N73-32932

**RECTANGULAR PLATES**  
Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer A73-44899

**RECTANGULAR WINGS**  
On the application of a new version of lifting surface theory to nonslender and kinked wings, A73-43210  
Analysis of inviscid flow field around rectangular wing of finite thickness in supersonic flow N73-32166

**REENTRY PHYSICS**  
A theoretical and experimental study of sound attenuation in an annular duct. [AIAA PAPER 73-1005] A73-44838

**REENTRY VEHICLES**  
Wind tunnel tests to determine static and dynamic stability coefficients for circular cone with various nose bluntness configurations [AD-765164] N73-31934

**REFERENCE SYSTEMS**  
Design of multivariable adaptive model following control systems, A73-43288

**REGIONAL PLANNING**  
Regional airport planning in Germany [DGLR-PAPER-73-035] N73-32159

**REGULATIONS**  
International air transportation policy and application of policy to scheduled and chartered airline services N73-32903

**REINFORCED SHELLS**  
Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers, A73-44377

**RELIABILITY ANALYSIS**  
Reliability estimation for repairable and nonrepairable flight vehicles, considering nomographs for failure rate and probability of defined requirements satisfaction A73-45197

- Application of reliability analysis to aircraft structures subject to fatigue crack growth and periodic structural inspection  
[AD-760775] N73-32383
- RELIABILITY ENGINEERING**  
Toward reliable composites - An examination of design methodology. A73-45144  
Total In-Flight Simulator for X-22A aircraft based on variable stability-and-control system concept for reliability design A73-45153  
Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage A73-45155  
Development of mechanical equipment reliability prediction techniques  
[AD-765367] N73-32399
- REMOTE REGIONS**  
Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend [ASME PAPER 73-ICT-72] A73-43498
- REMOOTLY PILOTTED VEHICLES**  
Remotely piloted vehicle /RPV/ for reconnaissance, electronic warfare systems, target acquisition, weapon delivery, air-air combat and different combinations A73-45399  
Development and characteristics of air cushion landing system for remotely piloted vehicles  
[AD-760774] N73-31985
- REQUIREMENTS**  
Financial requirements of air transportation industry N73-32861
- RESCUE OPERATIONS**  
Systems analysis of aviorics and aircraft equipment for search and rescue helicopters to determine cost effective improvements - Vol. 7 [AD-764910] N73-33381
- RESEARCH AND DEVELOPMENT**  
Management and control of commercial flight test programs A73-44057  
P and D efforts for various aircraft construction materials, considering steels, alloys and fiber-containing laminates A73-45198  
Development of US commercial air transport industry N73-32849  
Advances in technology and armament in USSR [AD-763323] N73-32917
- RESEARCH FACILITIES**  
NATC test facilities A73-44063  
Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements A73-45088
- RESEARCH MANAGEMENT**  
Management and control of flight test programs of the Western Region FAA. A73-44053  
Management of Air Force test and evaluation activities A73-44055  
Management and control of flight test programs of the Naval Air Systems Command. A73-44056  
Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships A73-44066
- RESEARCH PROJECTS**  
Research project to determine factors involved in expansion of air freight traffic and prospects for future expansion N73-32884  
Characteristics and performance of piloted simulator for application as research tool in design and development of experimental aircraft N73-32955
- RESONANT VIBRATION**  
Study and calculation of the vibrations of a rotating rotor with allowance for clearances in the bearings A73-43725
- RESOURCE ALLOCATION**  
Congressional hearings on causes and implications of impending shortages of gasoline, heating oil, diesel fuel, jet fuel, and electricity N73-33928
- REVERBERATION**  
Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel.  
[AIAA PAPER 73-1047] A73-44871
- ROCKET THRUST**  
Pulsated over-heated water rocket /POHWARO/ thrust augmentation system for combat aircraft takeoff runs from short runways under severe weather conditions A73-45391
- ROTARY WING AIRCRAFT**  
Feedback control for rotary wing aircraft steep approach profiles  
[NBB-UF-1021-0] N73-31967  
Rotary wing aircraft steep instrument approach limits  
[NBB-UD-101-73-0] N73-31969
- ROTARY WINGS**  
Spectral trends in rotor noise generation.  
[AIAA PAPER 73-1033] A73-44862  
Natural, flexural and torsional vibration frequencies and modes for helicopter tail rotor blades A73-45245  
A comparison of the overall and broadband noise characteristics of full-scale and model helicopter rotors. A73-45264  
Bibliography of technical reports of helicopter engines and rotary wings  
[AD-764900] N73-31981  
Wind tunnel tests of high harmonic circulation control rotary wing model to show instruments required and data acquisition procedures  
[AD-765320] N73-31984
- ROTATING BODIES**  
Inviscid, isentropic, three-dimensional flow theory for rotating thin blade row in cylindrical duct N73-32193
- ROTATING FLUIDS**  
Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core. A73-45309
- ROTATING SHAFTS**  
Increasing the critical rotational speed of the tail rotor drive shaft in SM-1 and SM-2 helicopters A73-45195
- ROTOR AERODYNAMICS**  
Study and calculation of the vibrations of a rotating rotor with allowance for clearances in the bearings A73-43725  
Spectral trends in rotor noise generation.  
[AIAA PAPER 73-1033] A73-44862
- ROTOR BLADES**  
The effects of modulated blade spacing on static rotor acoustics and performance.  
[AIAA PAPER 73-1020] A73-44852  
Multiple pure tone noise generation and control.  
[AIAA PAPER 73-1021] A73-44853
- ROTOR BLADES (TURBOMACHINERY)**  
Effects of blade tip clearance and leading edge sweepback of compressor rotor blades on inducer performance and blade pressure loading  
[NASA-CR-72712] N73-31930  
Noise comparison of two STOL pressure ratio fans with 15 and 42 rotor blades  
[NASA-TM-X-28911] N73-32609  
Capacitive method for measuring blade tip clearance in running turbocompressors  
[DLR-FB-72-40] N73-32628
- ROTORS**  
Increasing the critical rotational speed of the tail rotor drive shaft in SM-1 and SM-2 helicopters A73-45195  
Equations of motion formulated to compute transient response of multi-mass flexible rotors  
[NASA-CR-2300] N73-32374

RUNWAY CONDITIONS

Pulsated over-heated water rocket /POHWAHO/ thrust augmentation system for combat aircraft takeoff runs from short runways under severe weather conditions  
A73-45391

RUNWAYS

Dual lane runway configuration design and operational characteristics investigation by real time computer simulation for solution to airport capacity problem  
[ASME PAPER 73-ICT-611] A73-43496  
Airport runway and taxiing surfaces modifications for heavy and supersonic aircraft demonstrated by aircraft static and dynamic landing loads and physical dimensions A73-45199  
Test results and evaluation procedure for nondestructive tests of airfield pavements [AD-764787] N73-32382

S

SANDWICH STRUCTURES

Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods A73-43735  
Aluminum brazed titanium honeycomb sandwich structure - A new system. A73-44000

SECONDARY FLOW

Jet noise emission and reduction by secondary cold annular flow for SST and military aircraft N73-32543

SECONDARY INJECTION

Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer A73-45076

SENSITIVITY

Sensitivity, adaptivity and optimality; Proceedings of the Third Symposium, Ischia, Italy, June 18-23, 1973. A73-43277

SEPARATED FLOW

Airfoil theory calculation of bent thin foil lift coefficient and longitudinal moment characteristics at arbitrary flow separation point location A73-43720

SHEAR STRESS

Turbulent shear stress profiles in boundary layer flow at sine wave pressure perturbations N73-33194

SHIELDING

Assessment of jets as acoustic shields by comparison of single and multistage suppressor nozzle data [NASA-TN-X-71450] N73-33179

SHIPS

Computerized simulation of interactions of VTOL aircraft taking off from or landing on deck of ship moving in irregular or random seaway [AD-764865] N73-31980

SHOCK WAVE PROFILES

Hypersonic flow about a spatial body with an attached shock wave A73-45172

SHOCK WAVE PROPAGATION

Inlet geometry and axial Mach number effects on fan noise propagation. [AIAA PAPER 73-1022] A73-44854  
Determination of the impulses and moments imparted by shock waves to bodies of revolution A73-45542

SHOCK WAVES

Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel A73-44702  
Flow field over pointed wedges in isoeenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation A73-45547  
Analysis of sonic boom characteristics based on second order solutions for flow distribution around slender bodies in supersonic flow - Part 1 [NASA-CR-2339] N73-31927

Development of wind tunnel with self correcting apparatus based on sensors to determine flow conditions on tunnel surfaces and method for varying wall geometry N73-32161  
[AD-764957]  
Shock wave pattern and stability in axial flow supersonic compressor using simulated rotating cascade test facility N73-32196

SHORT HAUL AIRCRAFT

Application of short takeoff aircraft for short haul air transportation with identification of critical technology, economics, and social viability [NASA-CP-135481] N73-31941  
Dynamic response of short haul aircraft to gust loads [POK-K66] N73-31960  
Economics, traffic demand, and community acceptance of short haul air transportation system in California Corridor - Vol. 1 [NASA-CP-114634] N73-32802  
Forecast model for predicting economic factors involved in short haul air transportation in California Corridor - Vol. 2 [NASA-CR-114634 (1)] N73-32843  
Analysis of commuter air transportation services to define problems and identify methods for improvements in cost effective operations N73-32885  
Operation of low cost local air service carriers to show methods for improving transportation services N73-32886  
Evaluation of new forms of air transport service for improving short haul air travel market N73-32887  
Actions by Civil Aviation Board to regulate and improve commuter air transportation services N73-32888  
Proceedings of conference on short takeoff and landing aircraft to determine aerodynamic characteristics and short haul transportation applications [NASA-SP-320] N73-32934  
Analysis of short-haul air transportation requirements to include aircraft development programs, economic factors, and environmental considerations N73-32935  
Objectives and findings of study to determine applicability of short takeoff aircraft for short-haul air transportation systems N73-32936  
Economic and environmental aspects of short takeoff aircraft used for short-haul air transportation systems N73-32937  
Short takeoff aircraft technology development related to requirements for expanded and improved short-haul air transportation system capabilities N73-32938  
Short haul aircraft operations in terminal area with concurrent conventional aircraft operations to show methods for improved utilization of facilities N73-32953  
Systems analysis of problems created in terminal area by application of short takeoff aircraft for providing high speed, short haul air transportation service N73-32958  
Specification of thrust control system for Airbus A 300 B, tested in Boeing 747 N73-32981

SHORT TAKEOFF AIRCRAFT

Short takeoff and landing /STOL/ aircraft technology developments for high density air transport, discussing lift system, handling, airfoil design, acoustics and operating economics A73-43520  
Program plan to develop airworthiness standards for STOL aircraft. A73-44990  
Aerodynamic wind tunnel performance of high bypass pressure ratio fan engine for STOL aircraft [NASA-TN-X-71445] N73-31931

- Takeoff and landing performance characteristics and field length requirements for jet short takeoff transport aircraft with full span, externally blown flaps  
[NASA-TN-D-74411] N73-31939
- Application of short takeoff aircraft for short haul air transportation with identification of critical technology, economics, and social viability  
[NASA-CR-135491] N73-31941
- Flight paths for short takeoff aircraft landing approach consistent with pilot preference passenger comfort, and microwave landing system limitations  
[NASA-TN-D-7298] N73-31949
- Evaluation of low speed flying qualities of short takeoff aircraft with externally blown flap wing or augmentor wing using flight simulator  
[NASA-TN-D-7454] N73-31951
- Display devices for short takeoff aircraft landing  
[DGLR-PAPER-73-038] N73-31961
- Noise reducing approach and takeoff profiles for short takeoff aircraft  
[MBB-UH-76-73-01] N73-31968
- Noise comparison of two STOL pressure ratio fans with 15 and 42 rotor blades  
[NASA-TN-X-28911] N73-32609
- Economic risk analysis for propeller STOL transport market  
N73-32866
- Proceedings of conference on short takeoff and landing aircraft to determine aerodynamic characteristics and short haul transportation applications  
[NASA-SP-320] N73-32934

N73-32936
- Economic and environmental aspects of short takeoff aircraft used for short-haul air transportation systems  
N73-32937
- Short takeoff aircraft technology development related to requirements for expanded and improved short-haul air transportation system capabilities  
N73-32938
- Aerodynamic and performance characteristics of short takeoff aircraft equipped with externally blown flaps  
N73-32939
- Wind tunnel tests to determine aerodynamic characteristics of five configurations of short takeoff aircraft wind tunnel models  
N73-32944
- Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration  
N73-32948
- Flight simulation to determine manual control of flight path and airspeed for approach and landing of powered lift jet short takeoff aircraft  
N73-32949
- Wind tunnel tests to determine magnitude of adverse ground effects on longitudinal aerodynamic coefficients of powered-lift short takeoff aircraft  
N73-32950
- Development and evaluation of active control system to provide ride smoothing on short takeoff aircraft  
N73-32951
- Flight simulation to determine effectiveness of head-up display for improving glide-slope tracking performance during steep visual approach of short takeoff aircraft  
N73-32952
- Flight tests of augmentor-wing jet STOL research aircraft to compare wind tunnel data with flight data for dynamic characteristics and limitations  
N73-32954
- Air traffic control problems created by introduction of large numbers of STOL aircraft into high density terminal area  
N73-32956
- Development and characteristics of 4-D guidance system for traffic control of STOL aircraft operating in congested areas  
N73-32957
- Systems analysis of problems created in terminal area by application of short takeoff aircraft for providing high speed, short haul air transportation service  
N73-32958
- Program plan to develop criteria for airworthiness standards applied to short takeoff aircraft used as transport service  
N73-32959
- Design and development of quiet, clean propulsion systems for short takeoff aircraft with emphasis on engine noise reduction  
N73-32961
- Characteristics of aerodynamic noise generated by interaction of airstream with flap surface to show location and control of noise sources  
N73-32963
- Wind tunnel tests to determine acoustic properties of externally blown flap and augmentor wing for short takeoff aircraft configurations  
N73-32965
- Aerodynamic noise characteristics of short takeoff aircraft with externally blown flaps and engines mounted over and under wing  
N73-32966
- Selection criteria and characteristics of quiet, clean propulsion systems for use with short takeoff aircraft  
N73-32967
- Fan and core engine noise suppression for STOL aircraft  
[NASA-TN-X-71448] N73-33741
- SIGNAL PROCESSING**  
DO-31 aircraft integrated flight control system for vertical velocity regulation in gliding, noting signal processing requirements  
N73-32983
- SIGNAL REFLECTION**  
Improvement of instrument landing systems with respect to multipath propagation effects and surface reflections  
[DGLR-PAPER-73-017] N73-32521
- SIMILITUDE LAW**  
Similitude theory for design optimization of automatic control systems for aircraft gas turbine engines  
[AD-764683] N73-32631
- Aerothermodynamic study of air cushion vehicles buffeting noting dynamical stability, nonlinear behavior, and similitude law  
[NT-33-1973] N73-32933
- SINE WAVES**  
Turbulent shear stress profiles in boundary layer flow at sine wave pressure perturbations  
N73-33194
- SINGLE CRYSTALS**  
Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage  
A73-45155
- SINGULAR INTEGRAL EQUATIONS**  
Approximate calculation of the cavitation flow past low-aspect-ratio wings  
A73-45540
- SLENDER BODIES**  
Aircraft aerodynamics problems covering slender body theory, atmospheric turbulence and boundary layers, wind tunnel contractions, radiator blocks, vortex induced oscillations, etc  
A73-44690
- Analysis of sonic boom characteristics based on second order solutions for flow distribution around slender bodies in supersonic flow - Part 1  
[NASA-CR-2339] N73-31927
- SLENDER CONES**  
A theoretical and experimental study of sound attenuation in an annular duct.  
[AIAA PAPER 73-1005] A73-44838
- SLENDER WINGS**  
Designing a slender-wing-type cantilever plate under conditions of unsteady creep  
A73-43728
- Hypersonic flow about a spatial body with an attached shock wave  
A73-45172

## SLIDING FRICTION

Fatigue life tests of ball motion and sliding friction in arched outer race ball bearing under thrust load  
[NASA-TM-X-71442] N73-32375

## SLIPSTREAMS

Effect of a slipstream on the acoustic radiation of ultrasonic annular jets  
A73-45358

## SLOTTED WIND TUNNELS

Slotted transonic wind tunnel tests on pitching delta wing enable selection of porous walls for interference free damping derivatives  
[ARC-R/M-3715] N73-32930

## SMALL PERTURBATION FLOW

The effect of walls on the lifting force of a solid-foil wing  
A73-43722  
Hypersonic flow about a spatial body with an attached shock wave  
A73-45172

Turbulent shear stress profiles in boundary layer flow at sine wave pressure perturbations  
N73-33194

## SOCIOLOGY

Airport establishment and operation with emphasis on regional planning, social factors, and economic forces  
N73-32877

## SOLAR ECLIPSES

Feasibility study for use of YF-12 aircraft as scientific instrument platform for observing 1970 solar eclipse  
[NASA-CR-135482] N73-32735

## SONIC BOOMS

A study to determine the feasibility of a low sonic boom supersonic transport.  
[AIAA PAPER 73-1035] A73-44863  
Acoustic velocity and sound propagation differences in incompressible and compressible fluids related to Mach cone formation and sonic boom effects  
A73-45269

Analysis of sonic boom characteristics based on second order solutions for flow distribution around slender bodies in supersonic flow - Part 1  
[NASA-CR-2339] N73-31927  
Theory for predicting sonic boom intensity and techniques for sonic boom suppression  
[FAA-PD-73-4] N73-31944

## SOUND FIELDS

Sound generation by wake cutting.  
[AIAA PAPER 73-1019] A73-44851  
Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer  
A73-44899

## SOUND GENERATORS

Sound generation by wake cutting.  
[AIAA PAPER 73-1019] A73-44851  
Fluid mechanics of hole tone whistle designed as efficient producer of discrete frequency sound  
N73-33170

## SOUND PRESSURE

The effects of modulated blade spacing on static rotor acoustics and performance.  
[AIAA PAPER 73-1020] A73-44852

## SOUND PROPAGATION

Theoretical studies of sound emission from aircraft ducts.  
[AIAA PAPER 73-1012] A73-44804  
Acoustic velocity and sound propagation differences in incompressible and compressible fluids related to Mach cone formation and sonic boom effects  
A73-45269

## SPACE PROGRAMS

Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135903] N73-33919  
Relationships between performance, safety, cost, and schedule parameters to generate program models for total space program  
[NASA-CR-135902] N73-33920

## SPACING

The effects of modulated blade spacing on static rotor acoustics and performance.  
[AIAA PAPER 73-1020] A73-44852

## SPECTRAL SIGNATURES

Infrared signatures of high performance jet aircraft and evaluation of air to air missile effectiveness  
[SLA-73-5271] N73-33929

## SPEED CONTROL

Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure  
A73-45475

## SPEED INDICATORS

Performance tests of hemispherical flow-direction sensor mounted on F-104 aircraft to develop Mach number position error calibration curve  
[NASA-TN-D-7461] N73-31956

## SPHERES

Analysis of aerodynamic drag on object moving in rarefied gas under nearly free molecular flow conditions  
N73-32923

## STABILITY DERIVATIVES

Jet aircraft flight tests for stability derivative determination comparing various measuring techniques  
[BMVG-PBWT-73-12] N73-31971

## STANDARDIZATION

Land-air-sea intermodal cargo container movement procedures and equipment design standardization to meet air transportability requirements  
[ASME PAPER 73-ICT-3C] A73-43493

## STATE VECTORS

Closed loop linear control system synthesis possibility under condition of incomplete information on state vector with application to aircraft longitudinal motion  
A73-44329

## STATIC STABILITY

Effects of artificial aircraft stability control on damping, and static stability recovery by controllers  
N73-32987

## STATIONKEEPING

Flight tests of modified F-100 aircraft to determine effectiveness of fast-acting flaps as direct-lift-control devices to improve station keeping  
[NASA-TM-X-2936] N73-32970

## STATISTICAL ANALYSIS

Statistical analysis of aircraft accidents occurring in US Civil Aviation during calendar year 1972 - Issue 5  
[NTSB-BA-73-7] N73-31942

## STATOR BLADES

Measurement of flow parameters in midspan double-circular-arc section of stator in subsonic flow and comparison with computed performance  
[NASA-TN-D-7425] N73-31932

## STORAGE TANKS

Incendiary vulnerability of dry bays adjacent to jet fuel tanks under gunfire  
[AD-764732] N73-32920

## STRAIN GAGES

Errors produced by the influence of unsteady heating in strain measurement by wire-type resistance strain gages  
A73-44292

## STRATOSPHERE

Effect of spatial variability of wind in stratosphere on flight of supersonic transports  
N73-33500

## STREAM FUNCTIONS (FLUIDS)

Navier-Stokes equation formulation in parabolic coordinates for flow in trailing vortex, obtaining asymptotic expansions for stream function and angular momentum  
A73-43275

## STRESS ANALYSIS

Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method  
A73-43723

## STRESS MEASUREMENT

Errors produced by the influence of unsteady heating in strain measurement by wire-type resistance strain gages  
A73-44292

**STRESS RELAXATION**

Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing

A73-43911

**STRESSED-SKIN STRUCTURES**

Acoustic fatigue resistance of aircraft structures at elevated temperatures.

[AIAA PAPER 73-998]

A73-44829

**STRUCTURAL DESIGN**

Environmental effects on fracture resistant and biaxial fatigue design of aircraft structures.

A73-43811

**STRUCTURAL MEMBERS**

Hot forging of aluminum alloy structural parts

[AD-764618]

N73-32384

**STRUCTURAL RELIABILITY**

Toward reliable composites - An examination of design methodology

A73-45144

**STRUCTURAL VIBRATION**

Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods

A73-43735

Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer

A73-44899

**SUBSONIC FLOW**

On the application of a new version of lifting surface theory to nonslender and kinked wings.

A73-43210

A new device for measuring local acoustic power output of subsonic jets

[AIAA PAPER 73-1042]

A73-44866

**SUBSONIC SPEED**

Progress in source noise suppression of subsonic tip speed fans

[AIAA PAPER 73-1032]

A73-44861

**SUPERSONIC COMBUSTION**

Piecewise-one-dimensional models of supersonic combustion and pseudoshock in a channel

A73-44702

Burn-up of the high temperature products of incomplete combustion in a supersonic flow by a second injection of oxidizer

A73-45076

**SUPERSONIC FLIGHT**

Exhaust emission measurements on turbojet engine plume at simulated supersonic flight

[AD-764717]

N73-32632

**SUPERSONIC FLOW**

Determination of the impulses and moments imparted by shock waves to bodies of revolution

A73-45542

Flow field over pointed wedges in isoeenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation

A73-45547

Analysis of sonic boom characteristics based on second order solutions for flow distribution around slender bodies in supersonic flow - Part 1

[NASA-CR-2339]

N73-31927

Flow interference between supersonic intake and airframe to show three dimensional separation of boundary layer

N73-32194

Shock wave pattern and stability in axial flow supersonic compressor using simulated rotating cascade test facility.

N73-32196

**SUPERSONIC JET FLOW**

Supersonic jet noise generated by large scale disturbances.

[AIAA PAPER 73-992]

A73-44827

Subsonic and supersonic jets and supersonic suppressor characteristics

[AIAA PAPER 73-999]

A73-44834

Effect of a slipstream on the acoustic radiation of ultrasonic annular jets

A73-45358

**SUPERSONIC TRANSPORTS**

A study to determine the feasibility of a low sonic boom supersonic transport.

[AIAA PAPER 73-1035]

A73-44863

Effect of spatial variability of wind in stratosphere on flight of supersonic transports

N73-33529

**SURFACE CRACKS**

Fracture analysis of surface- and through-cracked sheets and plates.

A73-43813

**SURFACE TEMPERATURE**

Annual variations of Garda Lake surface temperature using airborne bolometric equipment and earth based infrared video equipment

N73-32298

**SWEEP WINGS**

Wake development on models of elliptic, rectangular, swept and delta planforms when plunged in water

[ARC-CP-1238]

N73-32932

Wind tunnel tests to determine basic performance of swept augmentor wing configuration and effect on longitudinal characteristics of aircraft

N73-32941

**SWIRLING**

Swirling flow effect on jet noise suppression based on acoustic field and engine thrust measurements with and without stationary swirl vanes in exhaust nozzle

[AIAA PAPER 73-1093]

A73-44836

**SWITCHES**

Logic and design procedures for multifunction mode switching controls in jet aircraft cockpits

[AD-764617]

N73-32141

**SWITCHING CIRCUITS**

AC starter generator featuring variable-to-constant frequency conversion by cycloconverters as switching device for use with aircraft engines

A73-45154

**SYSTEM EFFECTIVENESS**

Management of Air Force test and evaluation activities.

A73-44055

**SYSTEMS ANALYSIS**

Development and evaluation of active control system to provide ride smoothing on short takeoff aircraft

N73-32951

**SYSTEMS ENGINEERING**

Management and control of flight test programs of the Naval Air Systems Command.

A73-44056

**SYSTEMS STABILITY**

The prediction of instabilities of linear differential equations with periodic coefficients

[ARC-R/M-3713]

N73-33518

**T****T-33 AIRCRAFT**

Computer program for predicting pilot rating of pitch stability of T-33 aircraft under vertical turbulence conditions

[AD-764696]

N73-31974

**T-38 AIRCRAFT**

Ground-based devices for spatial orientation training in T-38 aircraft

[AD-764740]

N73-33157

**TACAN**

Description of sector-Tacan and DME-supported instrument landing systems

[DGLR-73-019]

N73-32523

**TACTICS**

Utilization of decision and value theory concepts by helicopter pilots to plan attacks

N73-33565

**TAIL ASSEMBLIES**

Increasing the critical rotational speed of the tail rotor drive shaft in SM-1 and SM-2 helicopters

A73-45195

**TAKEOFF**

Noise reducing approach and takeoff profiles for short takeoff aircraft

[NBB-08-06-73-0]

N73-31969

**TAKEOFF RUNS**

Pulsated over-heated water rocket /POHWARD/ thrust augmentation system for combat aircraft takeoff runs from short runways under severe weather conditions

A73-45391

- Aircraft accident involving Boeing 707 aircraft following aborted takeoff at Kennedy International Airport, New York, on 13 August, 1972  
[WTSB-AAR-73-7] N73-31943
- TECHNOLOGICAL FORECASTING**  
Technological change measurement methodology for cost and production estimates with application to aircraft turbine engine development A73-44219  
Research Aviation Facility collected aircraft data processing, merging and enhancement problems, software development and future resource requirements A73-45088
- TECHNOLOGY ASSESSMENT**  
USA government and industry efforts on aircraft midair collision avoidance systems technology advancement, comparing cost effectiveness between airborne and ground based options [ASME PAPER 73-ICT-89] A73-43495  
Public air transportation service needs for nonurban areas, considering low traffic density problem, operational requirements and future trend [ASME PAPER 73-ICT-72] A73-43498  
Management of Air Force test and evaluation activities A73-44055
- TECHNOLOGY UTILIZATION**  
Improving air transportation to low density population regions [NASA-CP-110484] N73-32905
- TEMPERATURE DISTRIBUTION**  
Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades A73-43740  
Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators A73-44294  
Full-scale ground tests of externally blown flap system on F-111 aircraft wing to determine pressure and temperature distributions on undersurface of wing, vane, and flap N73-32947
- TEMPERATURE EFFECTS**  
The effect of variable environment temperature on heat transfer in extended surfaces A73-43296  
Emissions from and within an Allison J-33 combustor II - The effect of inlet air temperature A73-43327  
Errors produced by the influence of unsteady heating in strain measurement by wire-type resistance strain gages A73-44292
- TEMPERATURE MEASURING INSTRUMENTS**  
Determination of the temperature fields of turbine disks and blades, using irradiated diamond indicators A73-44294
- TENSILE STRESS**  
Fracture analysis of surface- and through-cracked sheets and plates A73-43813
- TENSILE TESTS**  
Response of glass-fiber-reinforced epoxy specimens to high rates of tensile loading A73-43385
- TERMINAL FACILITIES**  
Numerical analysis of curved approach paths and landing sequence for multiple aircraft using same terminal facilities to provide maximum system performance N73-31935  
Analysis and simulation of intermittent positive control of air traffic by fully automated ground facility N73-32511  
Air traffic control radar beacon system interference in terminal areas [NTR-6239] N73-32512  
Evaluation of air traffic control beacon alphanumeric system for automatic operation in low density airport towers and terminal facilities [FAA-AA-73-54] N73-32516
- Air traffic control evaluation to determine feasibility of combining smaller aircraft into gaps on flow of normal traffic to increase effectiveness of terminal facilities [FAA-AFS-500-1] N73-32517  
Patterns of behavior of airlines and air travellers in air transportation network and effects on use of satellite airports N73-32876  
Short haul aircraft operations in terminal area with concurrent conventional aircraft operations to show methods for improved utilization of facilities N73-32953  
Air traffic control problems created by introduction of large numbers of STOL aircraft into high density terminal area N73-32956  
Development and characteristics of 4-D guidance system for traffic control of STOL aircraft operating in congested areas N73-32957  
Systems analysis of problems created in terminal area by application of short takeoff aircraft for providing high speed, short haul air transportation service N73-32958
- TEST EQUIPMENT**  
Development of instrument to measure steady and oscillatory aerodynamic forces on sting-mounted model using forced oscillation technique [ATN-7101] N73-33366
- TEST FACILITIES**  
Society of Flight Test Engineers, National Symposium, 3rd, Arlington, Tex., September 11-14, 1972, Proceedings A73-44052  
Flight test programs management and control, considering weapon systems performance tests relative to contractual requirements, personnel allocation and supporting facilities A73-44060  
NAFEC test facilities A73-44063  
The capabilities of army test facilities A73-44068  
Naval test and evaluation capabilities for aircraft, emphasizing organizational relationships A73-44066

Airfoil theory calculation of bent thin foil lift coefficient and longitudinal moment characteristics at arbitrary flow separation point location A73-43720
- THIN WINGS**  
On the application of a new version of lifting surface theory to nonslender and kinked wings A73-43210  
Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method A73-43723

## THREE DIMENSIONAL FLOW

Classification of methods for solving the direct problem of axisymmetric flow calculation in turboengines

A73-43736

Total pressure loss distribution in viscous gas flow through annular cascades of axial flow compressors, examining three dimensional flow effects on boundary layer development

A73-44916

Hypersonic flow about a spatial body with an attached shock wave

A73-45172

Determination of the impulses and moments imparted by shock waves to bodies of revolution

A73-45542

Inviscid, isentropic, three-dimensional flow theory for rotating thin blade row in cylindrical duct

N73-32193

Kutta-Joukowski condition for describing three dimensional flow over arbitrary wing  
[RAP-LIB-TRANS-1709]

N73-33185

## THRUST AUGMENTATION

Pulsated over-heated water rocket /POHWARO/ thrust augmentation system for combat aircraft takeoff runs from short runways under severe weather conditions

A73-45391

Adjustable airfoil for reversable cowl flap inlet thrust augmentation  
[NASA-CASE-ARC-10758-1]

N73-32624

## THRUST CONTROL

Specification of thrust control system for Airbus A 300 B, tested in Boeing 707

N73-32981

## THRUST MEASUREMENT

Swirling flow effect on jet noise suppression based on acoustic field and engine thrust measurements with and without stationary swirl vanes in exhaust nozzle  
[AIAA PAPER 73-1003]

A73-44836

## TILTING ROTORS

Far field noise reduction of tilting rotor aircraft based on performance and weight tradeoffs to improve acoustic signatures  
[NASA-CR-118608]

N73-31937

Mathematical model for real time simulation of tilt rotor aircraft to evaluate aircraft performance and handling qualities  
[NASA-CR-114601]

N73-31947

## TIP SPEED

Progress in source noise suppression of subsonic tip speed fans  
[AIAA PAPER 73-1032]

A73-44861

Acoustic tests of supersonic tip speed fan with acoustic treatment and rotor casing slots and its performance in reducing engine noise  
[NASA-CR-134511]

N73-32608

## TITANIUM ALLOYS

Fatigue crack growth retardation after single-cycle peak overload in Ti-6Al-4V titanium alloy

A73-43809

Fabrication techniques for Ti alloys in aerospace applications, discussing hot forming, electron beam and diffusion welding under vacuum and stress relaxation annealing

A73-43911

Aluminum brazed titanium honeycomb sandwich structure - a new system

A73-44000

## TORSIONAL VIBRATION

Natural, flexural and torsional vibration frequencies and modes for helicopter tail rotor blades

A73-45245

## TRAILING-EDGE FLAPS

Mechanisms of externally blown flap noise,  
[AIAA PAPER 73-1029]

A73-44859

Aerodynamic forces, pressure distribution, and wakes of wing profile with trailing edge flaps and leading edge slats

N73-33187

## TRAJECTORY ANALYSIS

Computer program for analyzing characteristics of parachute-payload system during deployment and trajectory

N73-31936

## TRAJECTORY OPTIMIZATION

Optimal landing flare control of aircrafts with sensitivity consideration.

A73-43284

## TRANSFER FUNCTIONS

Broadband noise generation by aerofoils and axial flow fans.  
[AIAA PAPER 73-1018]

A73-44850

## TRANSIENT RESPONSE

Equations of motion formulated to compute transient response of multi-mass flexible rotors  
[NASA-CR-2300]

N73-32374

## TRANSOCEANIC SYSTEMS

The transatlantic charter policy of the United States.

A73-44575

## TRANSONIC FLOW

Development of wind tunnel with self correcting apparatus based on sensors to determine flow conditions on tunnel surfaces and method for varying wall geometry  
[AD-764957]

N73-32161

## TRANSONIC WIND TUNNELS

Transonic wind tunnel tests to determine lift, drag, and stability characteristics of F-8 aircraft model with oblique wing  
[NASA-TM-X-62273]

N73-32974

## TRANSPORT AIRCRAFT

Takeoff and landing performance characteristics and field length requirements for jet short takeoff transport aircraft with full span, externally blown flaps  
[NASA-TM-D-7441]

N73-31939

Procedure for evaluating relative economic value of technology factors affecting design, configuration, and operation of hypersonic cruise transport  
[NASA-CR-2286]

N73-31953

Effect of noise constraints on engine cycle optimization for long-haul transports  
[NASA-TM-X-71447]

N73-32620

Forecast model for predicting economic factors involved in short haul air transportation in California Corridor - Vol. 2  
[NASA-CR-114634(1)]

N73-32843

Estimated costs for additional aircraft in air transport industry

N73-32860

Economic risk analysis for propeller STOL transport market

N73-32866

Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration

N73-32948

Air traffic control problems created by introduction of large numbers of STOL aircraft into high density terminal area

N73-32956

Wind tunnel tests of large scale subsonic jet transport with upper surface blowing flap system for lift augmentation  
[NASA-TM-X-62296]

N73-32973

Wind tunnel tests to determine acoustic properties of large scale lift fan transport aircraft model  
[NASA-TM-X-62284]

N73-32975

Computer program for evaluating techniques to improve aircraft engine response systems for application to long range commercial aircraft  
[NASA-CR-134496]

N73-32977

Acquisition of conditions of icing on modern civil transport aircraft from flight data

N73-33528

## TROPopause

Atmospheric turbulence near tropopause over mountainous terrain

N73-33525

## TROPOSPHERE

Meridional distribution of tropospheric ozone from measurements aboard commercial airliners.

A73-43859

## TURBINE BLADES

Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades

A73-43740

The problem of extrapolating test data on the efficiency of turbine-blade cooling to actual conditions

A73-43741

- Aircraft gas turbine engines with single crystal blades to avoid conventional casting grain boundary weakness and premature damage A73-45155
- Principal failures of turbines during turbine engine operation A73-45196
- TURBINE ENGINES**
- Technological change measurement methodology for cost and production estimates with application to aircraft turbine engine development A73-44219
- Ram air turbine with hydraulic pitch change servo regulated speed as emergency power source for aircraft control in event of main engine failure A73-45475
- Formula for computing operating cost of turbine powered transport aircraft N73-32852
- TURBOCOMPRESSORS**
- Total pressure loss distribution in viscous gas flow through annular cascades of axial flow compressors, examining three dimensional flow effects on boundary layer development A73-44916
- Measurement of flow parameters in midspan double-circular-arc section of stator in subsonic flow and comparison with computed performance [NASA-TN-D-7425] N73-31932
- Shock wave pattern and stability in axial flow supersonic compressor using simulated rotating cascade test facility N73-32196
- Aerodynamic design of inlet stage for two-stage compressor and performance comparison for axial, mixed flow, and centrifugal stage configurations [NASA-CR-120943] N73-32610
- Capacitive method for measuring blade tip clearance in running turbocompressors [DLR-FB-72-40] N73-32628
- Computerized design of axial compressor [AD-764733] N73-32633
- Computer program for design of axial compressor [AD-764734] N73-32634
- Influence of combustion chamber, compressor, and afterburner configuration on static performance of two-cycle turbojet engines with high bypass ratio N73-33756
- TURBOFAN ENGINES**
- The influence of aerodynamic flow noise in turbofan engines [AIAA PAPER 73-1016] A73-44848
- Multiple pure tone noise generation and control. [AIAA PAPER 73-1021] A73-44853
- Inlet geometry and axial Mach number effects on fan noise propagation. [AIAA PAPER 73-1022] A73-44854
- Turbofan engine core noise prediction and measurement, considering sources from flow passage obstructions, combustion chamber and turbine noise due to interaction with upstream turbulence [AIAA PAPER 73-1026] A73-44857
- Progress in source noise suppression of subsonic tip speed fans. [AIAA PAPER 73-1032] A73-44861
- Aerodynamic wind tunnel performance of high bypass pressure ratio fan engine for STOL aircraft [NASA-TM-X-71445] N73-31931
- Adhesive bonding of structures and composite materials on advanced turbofan engines N73-32470
- Finite difference theory of noise propagation in turbofan engine ducts [NASA-TN-D-7339] N73-33744
- Variable turbine geometry effect on engine installation and thrust modulation [AD-765533] N73-33761
- TURBOFANS**
- Noise comparisons from full-scale fan tests at NASA Lewis Research Center. [AIAA PAPER 73-1017] A73-44849
- Broadband noise generation by aerofoils and axial flow fans. [AIAA PAPER 73-1018] A73-44850
- Acoustic tests of supersonic tip speed fan with acoustic treatment and rotor casing slots and its performance in reducing engine noise [NASA-CR-130501] N73-32608
- Noise comparison of two STOL pressure ratio fans with 15 and 42 rotor blades [NASA-TM-X-2891] N73-32609
- TURBOJET ENGINE CONTROL**
- Computer program for evaluating techniques to improve aircraft engine response systems for application to long range commercial aircraft [NASA-CR-134496] N73-32977
- Performance of two-cycle turbojet engine for multi-parameter control under influence of jet vane and fuel throughput variations N73-33757
- TURBOJET ENGINES**
- Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods A73-43735
- Sensory odor tests of exhaust from turbojet engine combustor operating at simulated idle conditions [NASA-TM-X-71429] N73-32613
- Static tests of cylindrical ejectors using afterburning turbojet gas generators [NASA-TM-X-52565] N73-32622
- Exhaust emission measurements on turbojet engine plume at simulated supersonic flight [AD-764717] N73-32632
- Turbojet and turbine engine performance optimization by configuration variations, and auxiliary turbine engine converter problem [DLR-MIT-73-05] N73-33755
- Influence of combustion chamber, compressor, and afterburner configuration on static performance of two-cycle turbojet engines with high bypass ratio N73-33756
- Performance of two-cycle turbojet engine for multi-parameter control under influence of jet vane and fuel throughput variations N73-33757
- TURBOMACHINE BLADES**
- Inviscid, isentropic, three-dimensional flow theory for rotating thin blade row in cylindrical duct N73-32193
- TURBOMACHINERY**
- Classification of methods for solving the direct problem of axisymmetric flow calculation in turboengines A73-43736
- TURBOPROP ENGINES**
- Noise generation by turbulent combustion, discussing sound power, spectral content, enclosure effect, and importance in turbopropulsion system core engine noise [AIAA PAPER 73-1023] A73-44855
- TURBULENCE EFFECTS**
- Noise generation by turbulent combustion, discussing sound power, spectral content, enclosure effect, and importance in turbopropulsion system core engine noise [AIAA PAPER 73-1023] A73-44855
- Turbofan engine core noise prediction and measurement, considering sources from flow passage obstructions, combustion chamber and turbine noise due to interaction with upstream turbulence [AIAA PAPER 73-1026] A73-44857
- TURBULENT BOUNDARY LAYER**
- Emission of sound from a rectangular plate vibrating under the action of pressure pulsations in a turbulent boundary layer A73-44899
- TURBULENT DIFFUSION**
- Fuel combustion rate and turbulent diffusion induced self ignition in pulsejet engine combustion chamber from schlieren photography and pressure distribution measurements A73-45377
- TURBULENT JETS**
- Introduction of the viscous force sensing fluctuating probe technique, with measurement in the mixing zone of a circular jet. [AIAA PAPER 73-1044] A73-44868

**TURBULENT WAKES**

Analysis of random motions of vortex elements behind aircraft wing and design of vortex arrays to reduce wake-vortex to small aircraft  
[NASA-TM-X-62304] N73-32976

**TURBING FLIGHT**

Flight control display device for producing curved approach profiles in microwave instrument landing systems  
[DGLR-PAPER-73-016] N73-32526

**TWO DIMENSIONAL FLOW**

Some results from tests in the NAE high Reynolds number two dimensional test facility on shockless and other airfoils.  
A73-44995

Development of wind tunnel with self correcting apparatus based on sensors to determine flow conditions on tunnel surfaces and method for varying wall geometry  
[AD-764957] N73-32161

**TWO PHASE FLOW**

Thrust augmentation, lift forces, and mixing properties of two-phase flow propulsion and lift system for ground effect machines  
[AD-765332] N73-32208

**U****U.S.S.R.**

Advances in technology and armament in USSR  
[AD-763323] N73-32917

**UNSTEADY FLOW**

Broadband noise generation by aerofoils and axial flow fans  
[AIAA PAPER 73-1018] A73-44850

**URBAN TRANSPORTATION**

The role ground transportation can play in the airport site selection process.  
[ASMP PAPER 73-ICT-70] A73-43497  
Use of energy in transportation and implications for future  
[P-5025] N73-33921

**V****V/STOL AIRCRAFT**

Mathematical model for real time simulation of tilt rotor aircraft to evaluate aircraft performance and handling qualities  
[NASA-CR-114671] N73-31947  
VAK 191 B V/STOL fighter aircraft nonlinear feedback flight control system for gliding flight phase  
N73-32984

**VARIABLE GEOMETRY STRUCTURES**

Variable turbine geometry effect on engine installation and thrust modulation  
[AD-765533] N73-33761

**VARIABLE THRUST**

Variable turbine geometry effect on engine installation and thrust modulation  
[AD-765533] N73-33761

**VELOCITY MEASUREMENT**

Wing tip vortex measurements with laser Doppler velocimeter  
[NASA-CR-124444] N73-32924

**VERTICAL TAKEOFF AIRCRAFT**

Computerized simulation of interactions of VTOL aircraft taking off from or landing on deck of ship moving in irregular or random seaway  
[AD-764865] N73-31980  
Electronic display devices in aircraft control, noting pilot activation and VTOL control  
[DL3-MTT-72-04] N73-32998  
Extrapolation predictive displays for manual path and position control of VTOL aircraft  
N73-33000

**VHF OMNIRANGE NAVIGATION**

Radio frequency interference tests of VHF omnirange system, localizer, and glideslope receiving equipment to determine geographical separation requirements - Vol 2 Book 2  
[FAA-ED-73-1-VOL-2-BK-2] N73-32513

**VIBRATION DAMPING**

A study of a fluidic open loop damping flight stability augmentation system  
A73-43396

Study and calculation of the vibrations of a rotating rotor with allowance for clearances in the bearings  
A73-43725

**VIBRATION ISOLATORS**

Vibrations of turbojet-engine components containing structural dampers of the type of sandwich rods  
A73-43735

**VIBRATION MODE**

Natural, flexural and torsional vibration frequencies and modes for helicopter tail rotor blades  
A73-45245

**VIBRATION TESTS**

Increasing the critical rotational speed of the tail rotor drive shaft in SH-1 and SH-2 helicopters  
A73-45195

**VIBRATIONAL STRESS**

Effect of the circumferential nonuniformity of a temperature field in front of a turbine on the vibrational stresses in the turbine blades  
A73-43740

**VIDEO EQUIPMENT**

Annual variations of Garda Lake surface temperature using airborne bolometric equipment and earth based infrared video equipment  
[IFA-STR-23] N73-32298

**VISCOSITY**

On the effects of viscous interaction for a flat delta wing at incidence  
[ARC-CP-1237] N73-32931

**VISCOUS FLOW**

Computer solutions for potential and viscous flow calculations for engine inlets  
[NASA-TM-X-71457] N73-33184

**VISIBILITY**

Determination of visibility slant range when landing aircraft in radiation fog  
N73-33523

**VORTICES**

Navier-Stokes equation formulation in parabolic coordinates for flow in trailing vortex, obtaining asymptotic expansions for stream function and angular momentum  
A73-43205

Aircraft aerodynamics problems covering slender body theory, atmospheric turbulence and boundary layers, wind tunnel contractions, radiator blocks, vortex induced oscillations, etc  
A73-44690

Stability of a potential vortex with a non-rotating and rigid-body rotating top-hat jet core.  
A73-45309

Characteristics of low speed air flow over slender, sharp edged delta wing at various angles of attack and effects on longitudinal and lateral stability  
N73-32922

Wake development on models of elliptic, rectangular, swept and delta planforms when plunged in water  
[ARC-CP-1238] N73-32932

Analysis of random motions of vortex elements behind aircraft wing and design of vortex arrays to reduce wake-vortex to small aircraft  
[NASA-TM-X-62304] N73-32976

**W****WAKES**

Wake development on models of elliptic, rectangular, swept and delta planforms when plunged in water  
[ARC-CP-1238] N73-32932

**WALL FLOW**

The effect of walls on the lifting force of a solid-foil wing  
A73-43722

**WEAPON SYSTEM MANAGEMENT**

Management of Air Force test and evaluation activities.  
A73-44055  
Management and control of flight test programs of the Naval Air Systems Command.  
A73-44056

## WEAPON SYSTEMS

Management and control of military flight test programs at McDonnell Douglas St. Louis, Missouri, A73-44059

Flight test programs management and control, considering weapon systems performance tests relative to contractual requirements, personnel allocation and supporting facilities A73-44060

## WEAPON SYSTEMS

Remotely piloted vehicle /RPV/ for reconnaissance, electronic warfare systems, target acquisition, weapon delivery, air-air combat and different combinations A73-45399

## WEATHER

Aircraft landing problems under low visibility weather conditions [DGLR-PAPER-73-015] N73-32520

Meteorological and weather effects on aircraft landings and flights along air lanes and stratospheric wind effects on supersonic transports [JPRS-60114] N73-33522

## WEDGE FLOW

Flow field over pointed wedges in isoenergetic flow of thermally and calorically perfect gases with nonuniform incident supersonic flow, noting attached shock formation A73-45547

## WIND TUNNEL MODELS

Wind tunnel tests to determine low speed characteristics of large scale model of F-14A aircraft with emphasis on high lift configuration stability [NASA-TM-X-62244] N73-31940

Wind tunnel tests to determine aerodynamic characteristics of three oblique, high aspect ratio wing and body combinations at Mach numbers between 0.60 and 1.40 [NASA-TM-X-62256] N73-32926

Wind tunnel tests to determine aerodynamic characteristics of oblique wing and body combination at Mach numbers between 0.60 and 1.40 [NASA-TM-X-62207] N73-32927

Wind tunnel tests to determine aerodynamic characteristics of five configurations of short takeoff aircraft wind tunnel models N73-32944

Wind tunnel tests of large scale subsonic jet transport with upper surface blowing flap system for lift augmentation [NASA-TM-X-62286] N73-32973

Transonic wind tunnel tests to determine lift, drag, and stability characteristics of F-8 aircraft model with oblique wing [NASA-TM-X-62273] N73-32974

Wind tunnel tests to determine acoustic properties of large scale lift fan transport aircraft model [NASA-TM-X-62284] N73-32975

Development of instrument to measure steady and oscillatory aerodynamic forces on sting-mounted model using forced oscillation technique [ATN-7101] N73-33366

## WIND TUNNEL STABILITY TESTS

Wind tunnel tests to determine stability and control characteristics of externally blown jet-flap configurations N73-32940

## WIND TUNNEL TESTS

Aircraft aerodynamics problems covering slender body theory, atmospheric turbulence and boundary layers, wind tunnel contractions, radiator blocks, vortex induced oscillations, etc A73-44690

On problems of flight over an extended angle-of-attack range A73-44692

Comparison of aircraft noise measured in flight test and in the NASA Ames 40- by 80-foot wind tunnel. [AIAA PAPER 73-1047] A73-44871

Wind tunnel tests to determine flow distribution at inlet locations on aircraft model for various aerodynamic configurations and airspeeds [NASA-TM-D-7364] N73-31929

## SUBJECT INDEX

Wind tunnel tests to determine low speed characteristics of large scale model of F-14A aircraft with emphasis on high lift configuration stability [NASA-TM-X-62244] N73-31940

Wind tunnel tests of high harmonic circulation control rotary wing model to show instruments required and data acquisition procedures [AD-765320] N73-31984

Hypersonic wind tunnel tests of air breathing engines N73-32158

Wind tunnel tests to determine basic performance of swept augmentor wing configuration and effect on longitudinal characteristics of aircraft N73-32941

Wind tunnel tests to determine aerodynamic characteristics of upper surface blown jet-flap concept incorporating high-bypass-ratio turbofan engines N73-32943

Wind tunnel tests to determine aerodynamic characteristics of five configurations of short takeoff aircraft wind tunnel models N73-32944

Transonic wind tunnel tests to determine effects on flutter of aerodynamic interference between pairs of closely spaced delta wings [NASA-CR-2331] N73-33887

## WIND TUNNEL WALLS

Slotted transonic wind tunnel tests on pitching delta wing enable selection of porous walls for interference free damping derivatives [ARC-R/M-3715] N73-32930

## WIND TUNNELS

Development of wind tunnel with self correcting apparatus based on sensors to determine flow conditions on tunnel surfaces and method for varying wall geometry [AD-764957] N73-32161

## WIND VARIATIONS

Effect of spatial variability of wind in stratosphere on flight of supersonic transports N73-33529

## WING FLAPS

Flight tests of modified F-100 aircraft to determine effectiveness of fast-acting flaps as direct-lift-control devices to improve station keeping [NASA-TM-X-2936] N73-32970

## WING LOADING

Determination of the deflections and stresses in a small-aspect-ratio wing by the displacement method A73-43723

## WING PANELS

Design analysis and fabrication of hypersonic wing test structure [NASA-CR-127490] N73-33883

## WING PLANFORMS

Wind tunnel tests to determine aerodynamic characteristics of three oblique, high aspect ratio wing and body combinations at Mach numbers between 0.60 and 1.40 [NASA-TM-X-62256] N73-32926

Wind tunnel tests to determine aerodynamic characteristics of oblique wing and body combination at Mach numbers between 0.60 and 1.40 [NASA-TM-X-62287] N73-32927

Aerodynamic characteristics of augmentor wings and analysis of augmentation and entrainment in defining a net thrust coefficient N73-32942

Simulations of powered-lift STOL transport aircraft with either externally blown flap configuration or augmentor wing configuration N73-32948

Flight tests of augmentor-wing jet STOL research aircraft to compare wind tunnel data with flight data for dynamic characteristics and limitations N73-32954

Wind tunnel tests to determine acoustic properties of externally blown flap and augmentor wing for short takeoff aircraft configurations N73-32965

## WING PROFILES

The effect of walls on the lifting force of a solid-foil wing A73-43722

Aerodynamic forces, pressure distribution, and  
wakes of wing profile with trailing edge flaps  
and leading edge slats

N73-33187

## WING TIPS

Wing tip vortex measurements with laser Doppler  
velocimeter

[NASA-CR-120400]

N73-32924

## WINGS

Kutta-Joukowski condition for describing three  
dimensional flow over arbitrary wing

[RAE-LIB-TRANS-1709]

N73-33185

X

## X-22 AIRCRAFT

Total In-Flight Simulator for X-22A aircraft based  
on variable stability and control system concept  
for reliability design

A73-45153

# PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl. 39)

JANUARY 1974

## Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N73-11007. Under any one author's name the accession numbers are arranged in sequence with the IAA accession numbers appearing first.

## A

- ABRAMOVICH, K. G.**  
Analysis of meteorological conditions for aviation  
[JPRS-60114] N73-33522
- AIKEN, T. W.**  
Advanced augmentor-wing research N73-32942
- AKERS, J. P.**  
Operational evaluation of the ARTS 2 Radar  
Alphanumeric Display Subsystem (RADS)  
[FAA-NA-73-77] N73-33569
- ALBERS, J. A.**  
Calculation procedures for potential and viscous  
flow solutions for engine inlets  
[NASA-TM-X-71457] N73-33184
- ALEXANDER, A. J.**  
Measuring technological change - Aircraft turbine  
engines. A73-44219
- ALTENKIRCH, R. A.**  
Emissions from and within an Allison J-33  
combustor. II - The effect of inlet air  
temperature. A73-43327
- ALVAREZ, M. C.**  
Compressibility and sonic boom A73-45269
- ANDERS, H.**  
Noise reducing methods for STOL aircraft approach  
and take-off  
[MBB-UM-06-73-0] N73-31968
- ANDERSON, S. B.**  
Comparisons of simulator and flight results on  
augmentor-wing jet STOL research aircraft N73-32955
- ANDERSON, W. E.**  
Experimental investigation of a large-scale,  
two-dimensional, mixed-compression inlet system:  
Internal performance and drag at transonic  
conditions, free stream Mach equals 0.6 to 1.28  
[NASA-TN-D-7445] N73-31928
- ANDREWS, A. H.**  
Merqers and anti-trust issues in recent CAB cases  
N73-32895
- ANKIN, A. IA.**  
Utilization of semiartificial thermocouples in  
gas-turbine engine tests A73-43743
- ANTL, R. J.**  
The effect of noise constraints on engine cycle  
optimization for long-haul transports  
[NASA-TM-X-71447] N73-32620

- AOYAGI, K.**  
Acoustic characteristics of large-scale STOL  
models at forward speed N73-32965
- Wind tunnel investigation of a large-scale upper  
surface blown-flap transport model having two  
engines  
[NASA-TM-X-62296] N73-32973
- ARMENAKAS, A. E.**  
Response of glass-fiber-reinforced epoxy specimens  
to high rates of tensile loading. A73-43385
- ARMISTEAD, K. H.**  
Flight calibration tests of a nose-boom-mounted  
fixed hemispherical flow-direction sensor  
[NASA-TN-D-7461] N73-31956
- ARNOLD, J. D.**  
An improved method of predicting aircraft  
longitudinal handling qualities based on the  
minimum pilot rating concept  
[AD-764696] N73-31974
- ASADA, H.**  
On the process of precipitation in Mg-Ce alloy.  
A73-44155
- ASHBY, W. O.**  
Evaluation of existing VOR, localizer and  
glideslope receiving equipment, volume 2, book 2  
[FAA-RD-73-1-VOL-2-BK-2] N73-32513
- ATENCIO, A., JR.**  
Comparison of aircraft noise measured in flight  
test and in the NASA Ames 40- by 80-foot wind  
tunnel.  
[AIAA PAPER 73-1047] A73-44871
- Noise measurements from a large-scale lift fan  
transport in the 40- by 80-foot wind tunnel  
[NASA-TM-X-62284] N73-32975
- AUGUSTINE, J. G.**  
Air traffic forecasting at the Port Authority of  
New York and New Jersey N73-32879

## B

- BARBASHIN, E. F.**  
Determination of the temperature fields of turbine  
disks and blades, using irradiated diamond  
indicators A73-44294
- BARBER, J. H.**  
A study of rapid engine response systems for an  
advanced high subsonic, long range commercial  
aircraft  
[NASA-CR-134496] N73-32977
- BARBER, M. R.**  
A flight evaluation of curved landing approaches  
N73-32953
- BARCHE, J.**  
Experimental study of wing profile with Fowler  
flaps and slats N73-33187
- BAUGHMAN, P. H.**  
Management and control of flight test programs of  
the Naval Air Systems Command. A73-44056
- BAUMHISTEE, K. J.**  
A difference theory for noise propagation in an  
acoustically lined duct with mean flow.  
[AIAA PAPER 73-1007] A73-44840
- Numerical simulation of noise propagation in jet  
engine ducts  
[NASA-TN-D-7339] N73-33744

## BAZZHIN, A. P.

The effect of real properties of air on parameters of flow near an elliptic cone. Aerodynamic characteristics of elliptic cones at large angles of attack  
[AD-764945] N73-32209

## BEILMAN, J. L.

X-22A - The total in-flight simulator.  
A73-45153

## BENNER, E. S.

A fixed-base simulation study of two STOL aircraft flying curved, descending instrument approach paths  
[NASA-TN-D-7298] N73-31949

## BENNETT, G. W.

A study of rapid engine response systems for an advanced high subsonic, long range commercial aircraft  
[NASA-CR-134496] N73-32977

## BENZAKIN, M. J.

Multiple pure tone noise generation and control.  
[AIAA PAPER 73-1021] A73-44853

## BERT, C. W.

Dynamic buckling of an axially compressed cylindrical shell with discrete rings and stringers.  
A73-44377

## BIDWELL, L. R.

Thermal aging of silver-plated copper aircraft electrical wire  
[AD-764731] N73-32135

## BINDER, R. H.

International air transport and Federal policy  
N73-32902

## BITTNER, E. C.

Numerical simulation of noise propagation in jet engine ducts  
[NASA-TN-D-7339] N73-33744

## BLINOV, B. N.

Apparatus for thermomechanical surface treatment of organic glass, its effect, instructions and practical testing  
[AD-764972] N73-33510

## BOBERT, H.

Problems involved in developing an integrated flight control system with emphasis on curved flight path profiles  
[DGLR-PAPER-73-030] N73-31970

## BOGOMOLOV, E. N.

Thermodynamics of an air-cooled gas-turbine stage  
A73-43733

## BOGOVAIA, L. I.

Universal equations for the laminar boundary layer on a body of revolution in oblique flow  
A73-45529

## BOHR, T.

Flight operations and guide beam systems  
[DGLR-PAPER-73-011] N73-32522

## BOLTZ, F. W.

An experimental investigation of three oblique-wing and body combinations at Mach numbers between 0.60 and 1.40  
[NASA-TM-X-62256] N73-32926

An experimental investigation of an oblique-wing and body combination at Mach numbers between 0.60 and 1.40  
[NASA-TM-X-62207] N73-32927

## BOHNER, T. F., JR.

Potential of hydrogen fuel for future air transportation systems.  
[ASME PAPER 73-ICT-104] A73-43499

## BRAITHWAITE, W. M.

The effects of inlet temperature and pressure distortion on turbojet performance  
[NASA-TM-X-71431] N73-32614

## BROCKHAUS, R.

Flight control problems regarding steep approach  
[DGLR-PAPER-73-027] N73-31962

## BROWN, D.

Some results from tests in the NAE high Reynolds number two-dimensional test facility on shockless and other airfoils.  
A73-44995

## BROWN, T. J.

Externally blown flap dynamic loads  
N73-32946

## BRUCE, R. W.

Systems evaluation of low density air transportation concepts  
[NASA-CR-114484] N73-32905

## BRUENING, G.

Longitudinal motion of an air liner during steep approach  
[DGLR-PAPER-73-023] N73-31963

## BRUNNER, D.

Present status of all-weather landing: Problems and limits  
[DGLR-PAPER-73-015] N73-32520

## BRUCE, C. A.

Advanced two-stage compressor program design of inlet stage  
[NASA-CR-120943] N73-32610

## BUCHHEIMER, A.

Airport economics: Management control financial reporting systems  
N73-32878

## BUCHHOLZ, H. D.

Design problems of the Airbus A 300 B forward thrust regulator  
N73-32981

## BULDOVSKIY, G. S.

Turbulence near the tropopause in the presence of high altitude waves  
N73-33525

## BURNS, D. O.

Alternating current starter generators.  
A73-45154

## BUTLER, C.

International air transport policy  
N73-32899

## BUTZE, H. P.

Odor intensity and characterization studies of exhaust from a turbojet engine combustor  
[NASA-TM-X-71429] N73-32613

## C

## CAHN, C. R.

Spread spectrum applications and state of the art equipments  
N73-32058

## CARSON, T. M.

Flight results from a study of aided inertial navigation applied to landing operations  
[NASA-TN-D-7302] N73-32515

## CAYOT, J. E.

Program plan to develop airworthiness standards for STOL aircraft  
N73-32959

## CHANIS, C. C.

Experimental and theoretical investigation of HT-S/PMR-PI composites for application to advanced aircraft engines  
[NASA-TM-X-71459] N73-33502

## CHAUDHURI, S. N.

Fundamental research on advanced techniques for sonic suppression  
[FAA-RD-73-4] N73-31944

## CHELYSHEVA, I. P.

The effect of real properties of air on parameters of flow near an elliptic cone. Aerodynamic characteristics of elliptic cones at large angles of attack  
[AD-764945] N73-32209

## CHEN, R. T. H.

Development and evaluation of an automatic departure prevention system and stall inhibitor for fighter aircraft

# CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl. 39)

JANUARY 1974

## Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

# PUBLIC COLLECTIONS OF NASA DOCUMENTS

## DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

### CALIFORNIA

University of California, Berkeley

### COLORADO

University of Colorado, Boulder

### DISTRICT OF COLUMBIA

Library of Congress

### GEORGIA

Georgia Institute of Technology, Atlanta

### ILLINOIS

The John Crerar Library, Chicago

### MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

### MISSOURI

Linda Hall Library, Kansas City

### NEW YORK

Columbia University, New York

### PENNSYLVANIA

Carnegie Library of Pittsburgh

### WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "\*" following the accession number) are also received by the following public and free libraries:

### CALIFORNIA

Los Angeles Public Library

San Diego Public Library

### COLORADO

Denver Public Library

### CONNECTICUT

Hartford Public Library

### MARYLAND

Enoch Pratt Free Library, Baltimore

### MASSACHUSETTS

Boston Public Library

### MICHIGAN

Detroit Public Library

### MINNESOTA

Minneapolis Public Library

### MISSOURI

Kansas City Public Library

St. Louis Public Library

### NEW JERSEY

Trenton Public Library

### NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

### OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

### OKLAHOMA

Oklahoma County Libraries, Oklahoma City

### TENNESSEE

Memphis Public Library

### TEXAS

Dallas Public Library

Fort Worth Public Library

### WASHINGTON

Seattle Public Library

### WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

## EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "\*", from: ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.

POSTMASTER: If Undeliverable (Section 158  
Postal Manual) Do Not Return

*"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."*

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

## NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

**TECHNICAL REPORTS:** Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

**TECHNICAL NOTES:** Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

**TECHNICAL MEMORANDUMS:** Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

**CONTRACTOR REPORTS:** Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

**TECHNICAL TRANSLATIONS:** Information published in a foreign language considered to merit NASA distribution in English.

**SPECIAL PUBLICATIONS:** Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

**TECHNOLOGY UTILIZATION PUBLICATIONS:** Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

*Details on the availability of these publications may be obtained from:*

**SCIENTIFIC AND TECHNICAL INFORMATION OFFICE**

**NATIONAL AERONAUTICS AND SPACE ADMINISTRATION**

**Washington, D.C. 20546**
